The Clown Cannon

By Campbell Smith

2024

The Clown Cannon is a human cannon inspired ball launcher, designed to be used as a movie prop. The Cannon is a modified version of a tennis ball launcher, instead now launching balls painted to reassemble clown heads. The electronics used for the design are lighting effects, led around the end to show the cannon ‘powering up’, and a fuse on the back as a nod to its human cannon counterpart. The design is used by flicking the switch one by one, making the cannon seem like a powerful device, and resetting once the trigger is pulled and the clown is launched.

The cannon could be used as a stage, or film prop, likely to be handled by a clown character, or used in a carnival setting. The Clown Cannon concept is largely inspired by the film ‘Killer Klowns from Outer Space’, 1988, a film that features many wacky clown props.

Future iterations of the design would look to add more functionality, and accessories, potentially more lighting, sound effects, and a kill switch activated by pressure on the trigger.
