Geometric support through the center of the design.

Using more complex cross shape for the base that is twisted, I put the core in comparison the the structures triangular features.

Geometric wine bottle like shape.

I created this shape to give the design a full structure, and some softer angles, whilst still retaining a geometric look

Wire-frame shape based off of the same shapes used in the full shape.

The structure exists to juxtapose the full shape, the wireframe, unlike the full bottle, has no cures of smoothing, instead it is all jaggered straight lines, cutting out the 'waste' of the curves.

My goal with my branch was to make a design that stood out from the rest of the tree, I ended up going for a contrasting and geometric design.

Typically when designing things I look to the past and more organic shapes for inspiration, instead for this project I decided to look into more processed and manufactured design after seeing some geometric style furniture when shopping with my parents.

I found influence in many side-table designs for the more full side of the branch, and was lost when it came to the other. Trying different elements to get a juxtaposition I landed on wireframe, finding the negative space the most interesting. I went through a few different ideas situated in the frame and landed onto the more geometric pillar, giving the wire-frame side a perfect contrase to the full and more curvy side.

Timeline of Design
