101 Iterations: The Wave
Campell Smith

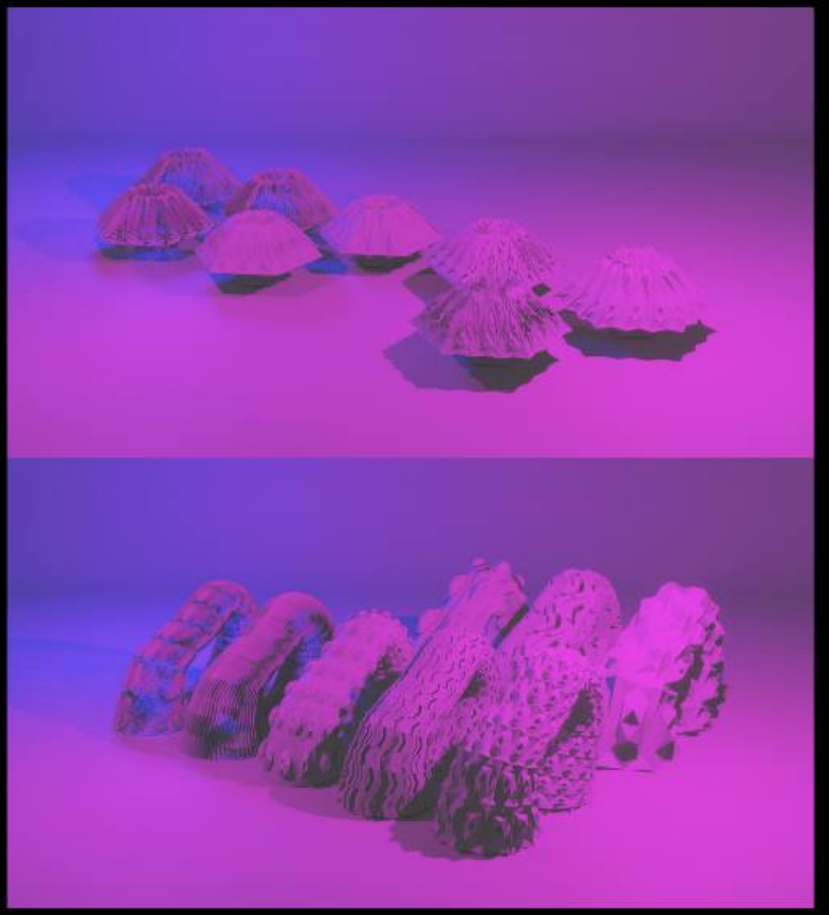

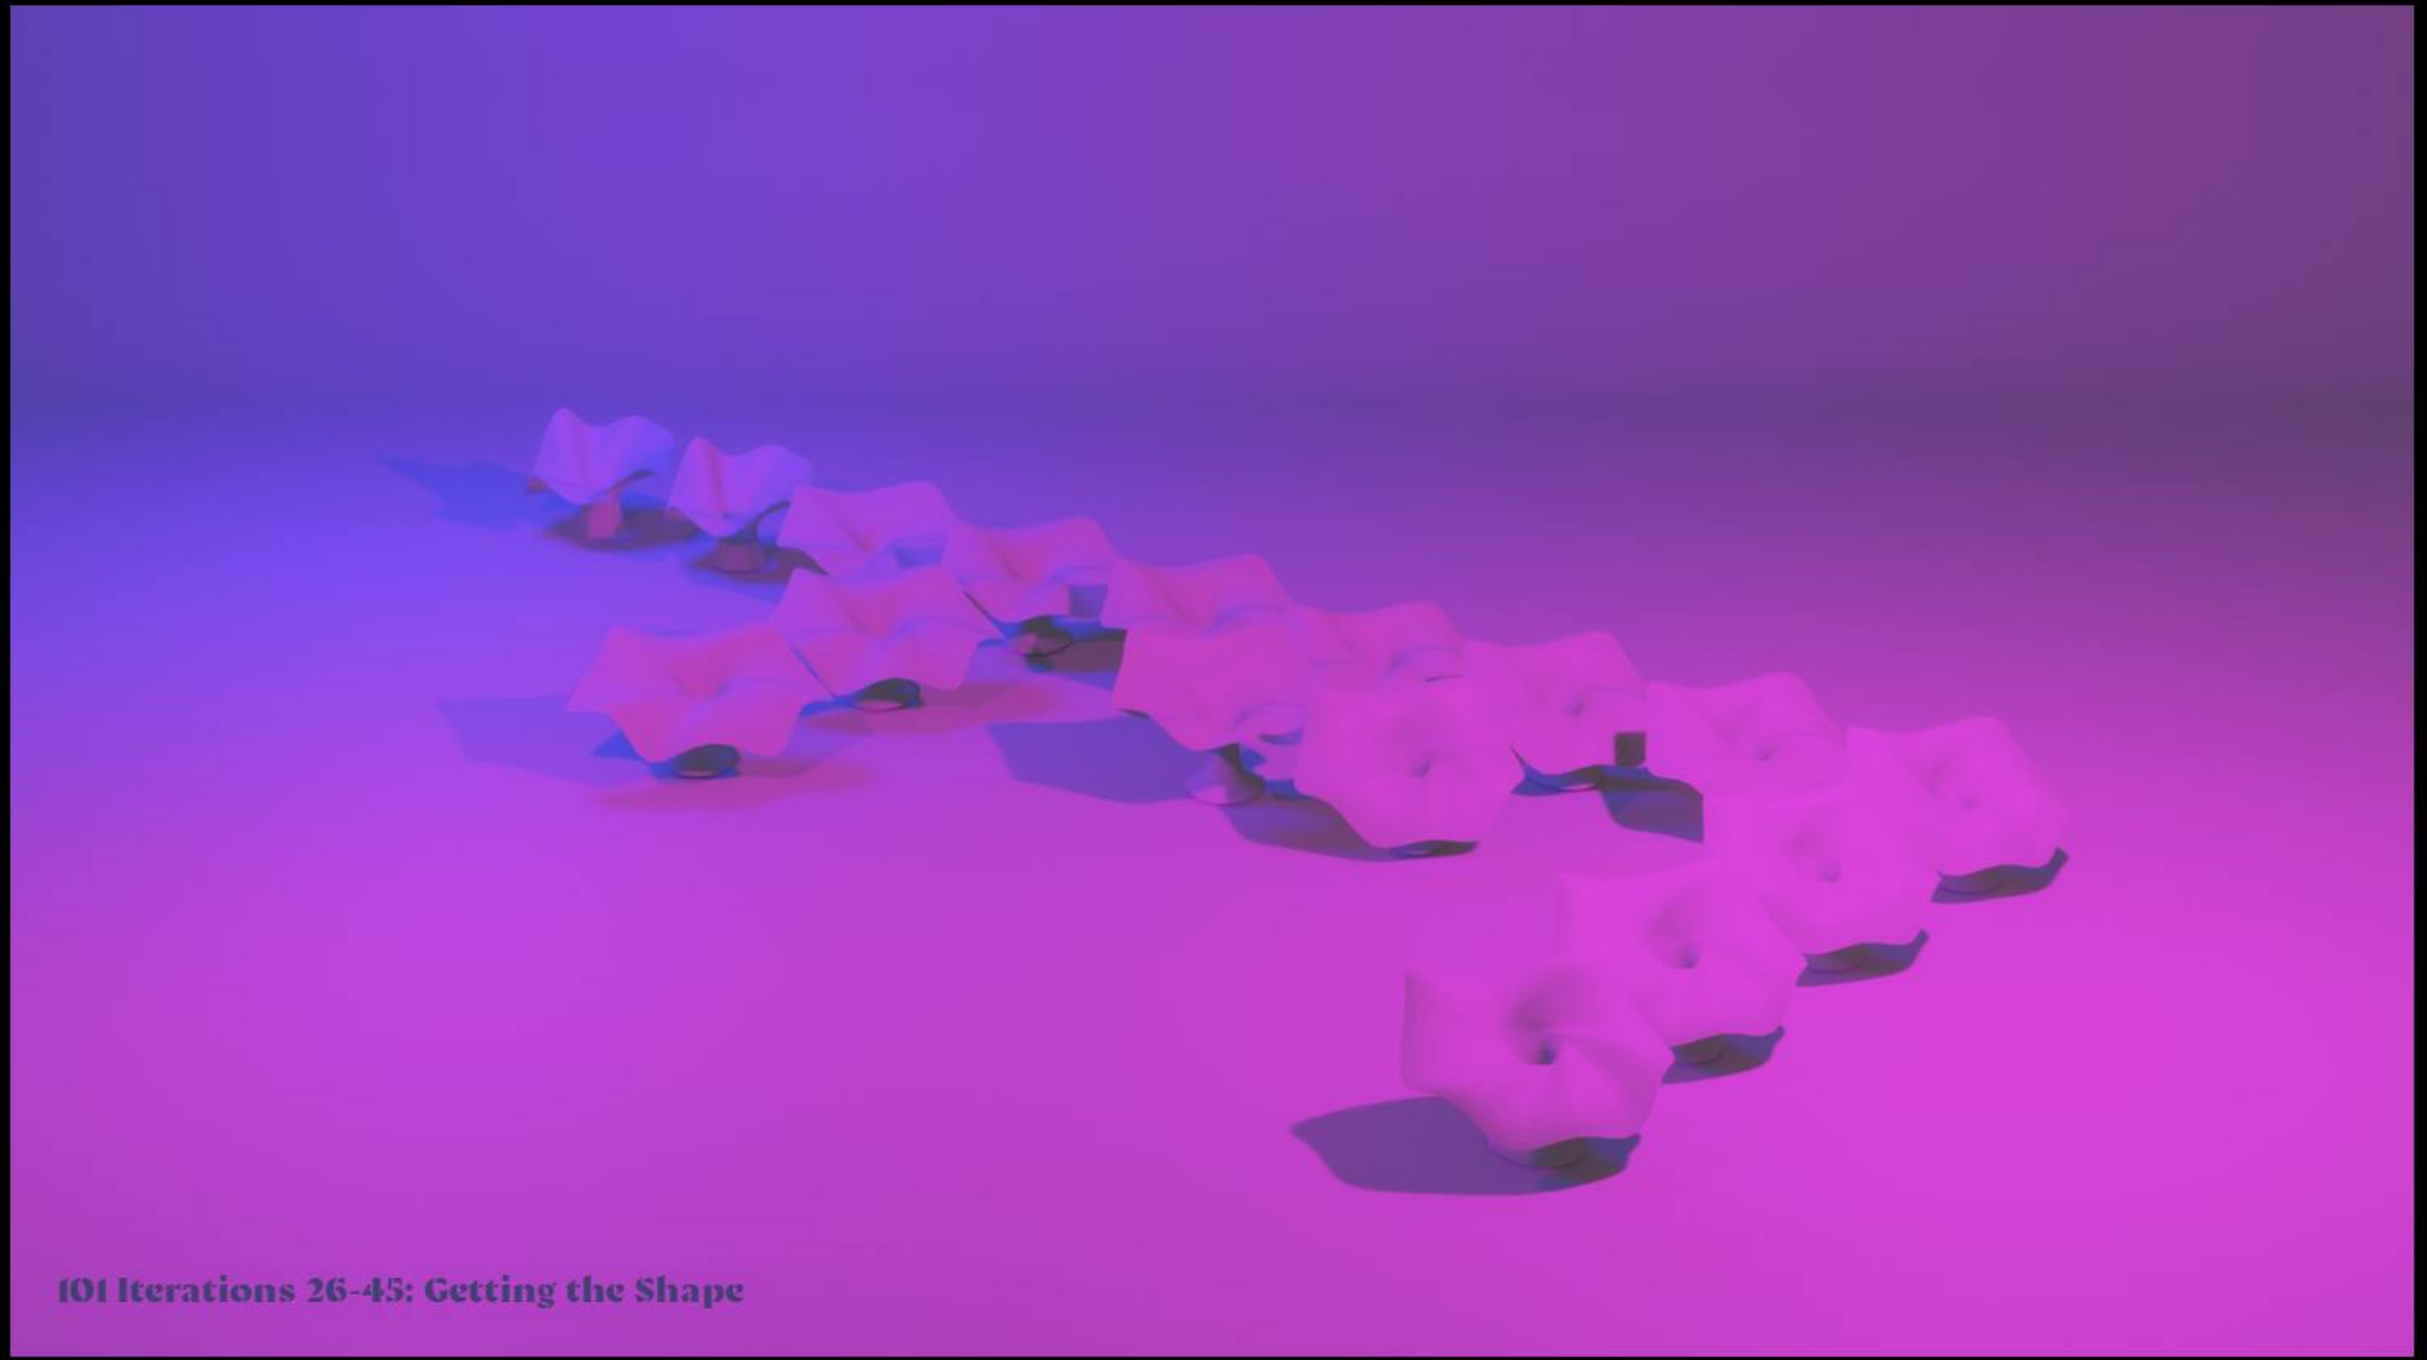

101 Iterations 1 - 25 Learning the ropes

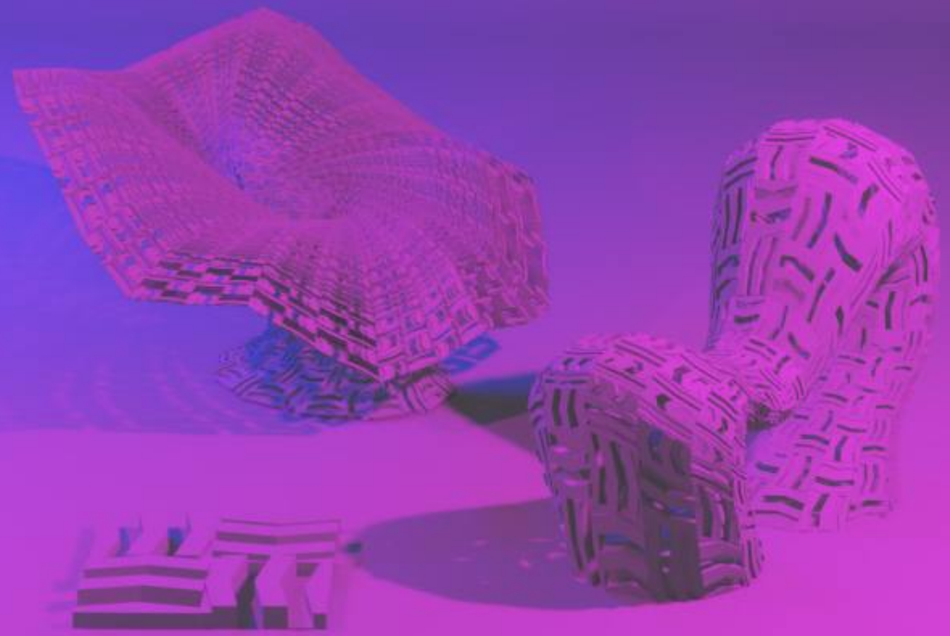

From my inial Ideas I wanted to look at a more organic model, to contrast a more strong component. I believe this interested me as I started to understand that Blender, and the sls printing technique, have less limitiations than typical 3D printing.

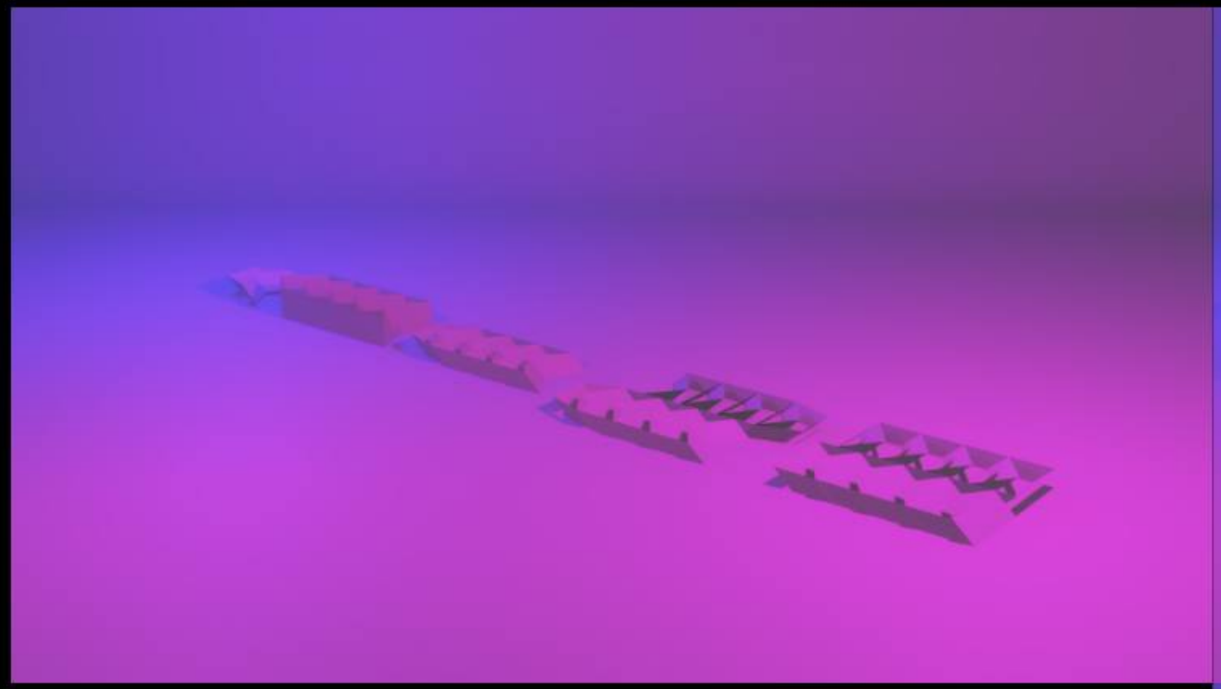

101 Iterations 26-45: Getting the Shape

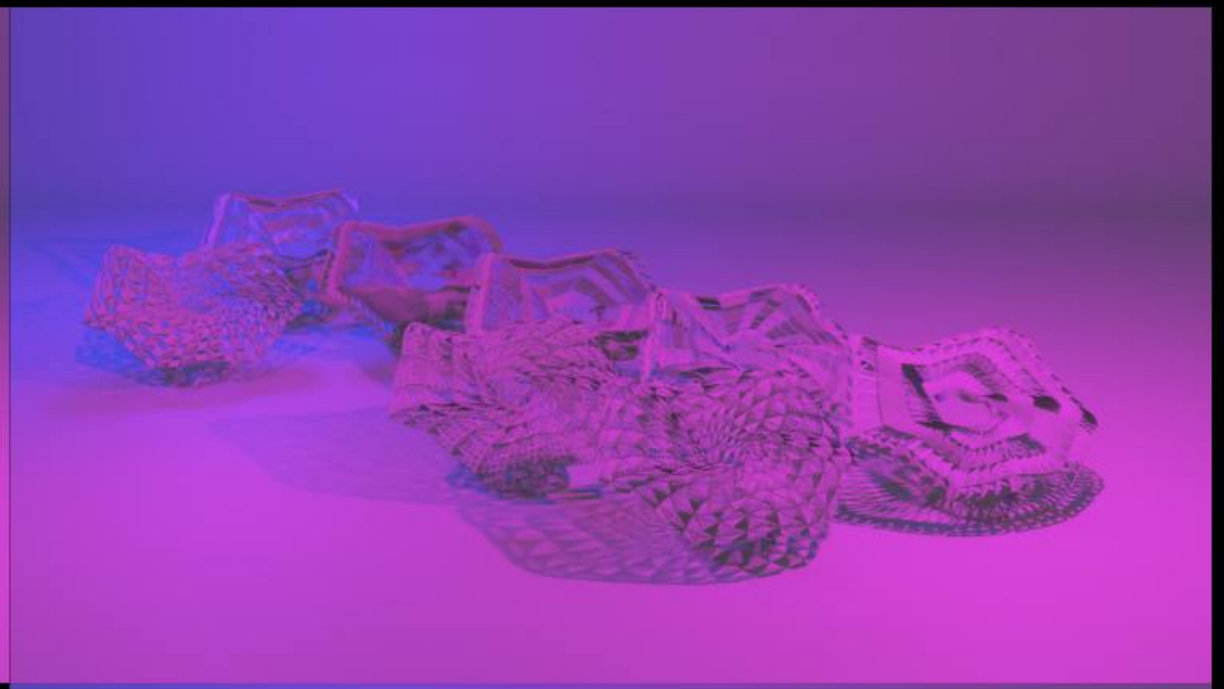

From this point I startted to develop my bass model, I worked two of my original Ideas alongside eachother, as I found both shapes interesting, the left, looking like a blooming flower, and the right, to me worked as a variation on a simple tube design.

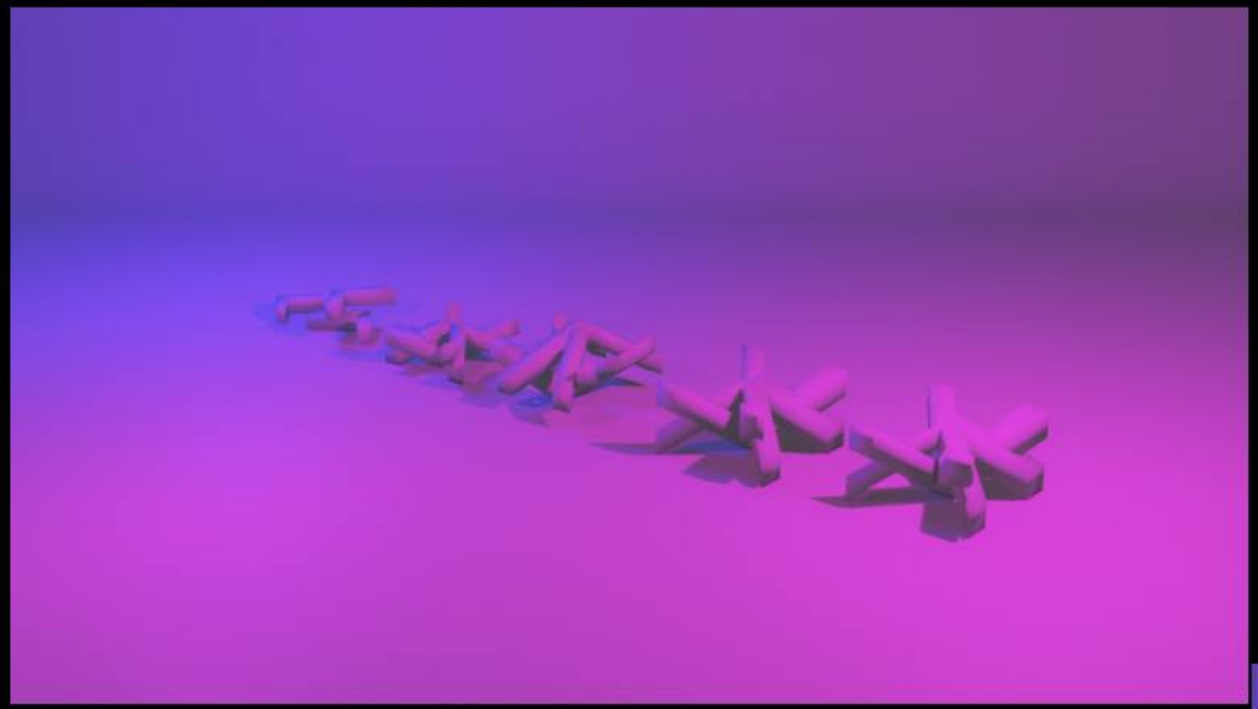

101 Iterations 46-72: Developing New Componnts

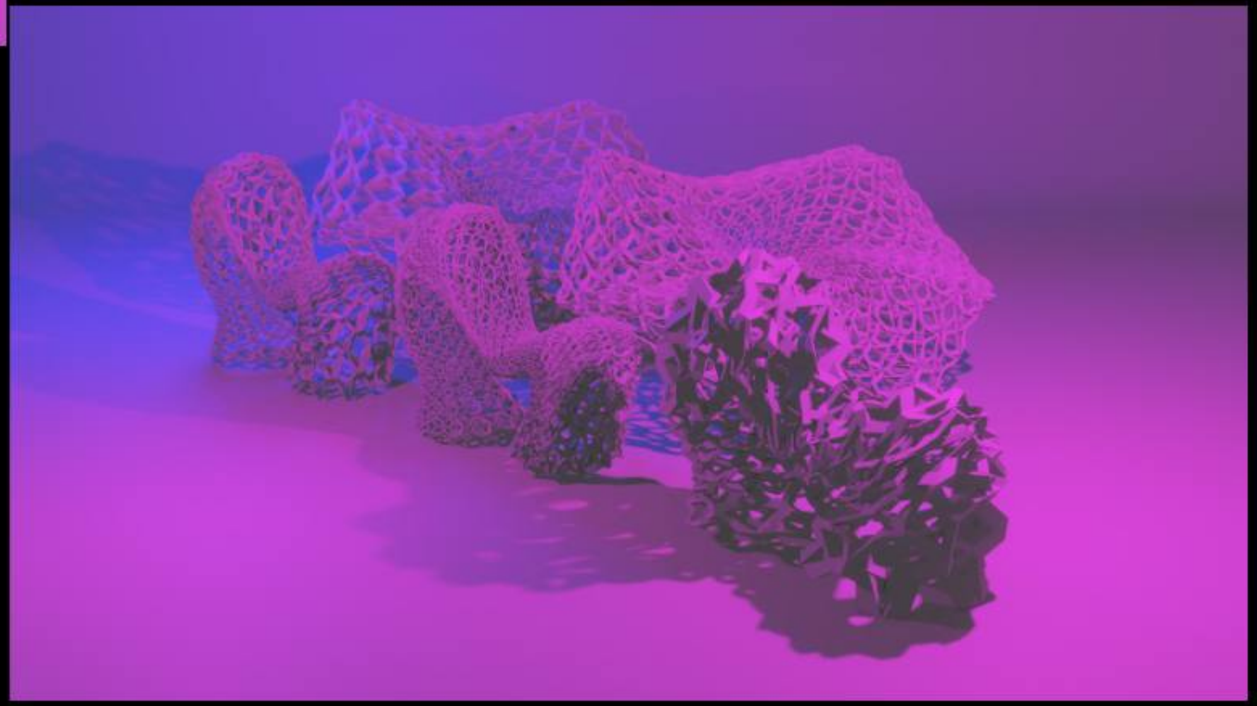

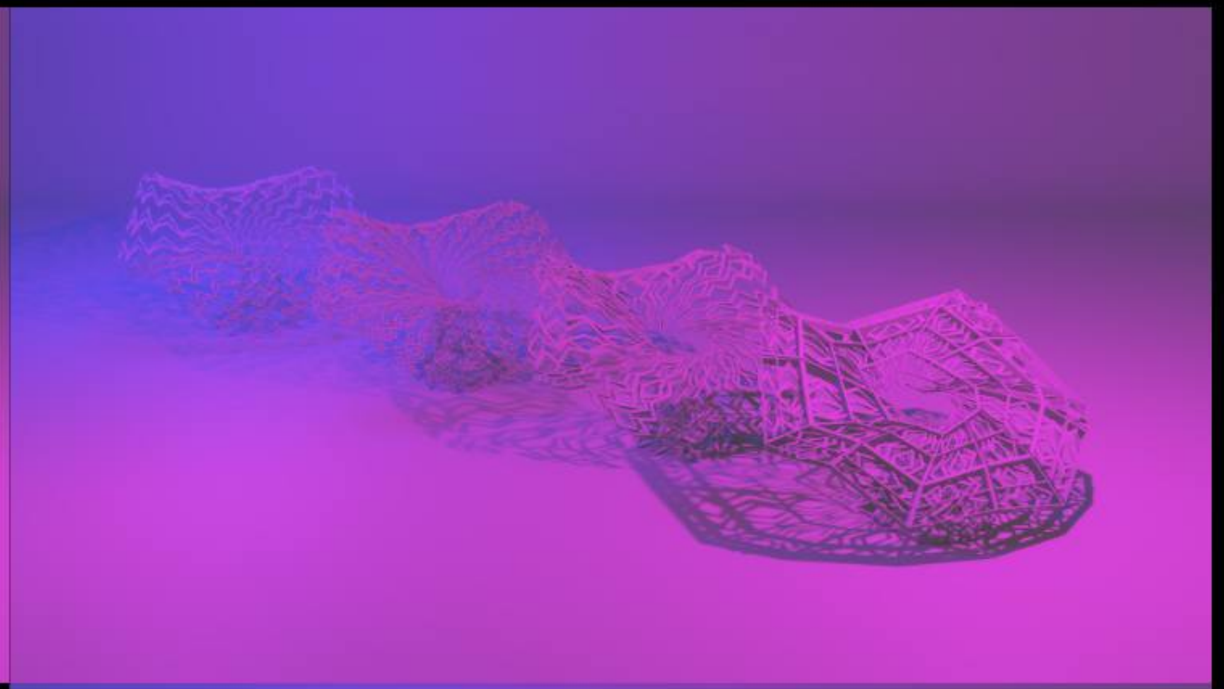

This is when i started to get an idea of the component I wanted to work with, using a triangular shape meant that I would get a lot of depth in my design, with it's appearance slightly varying at every angle you look at it.

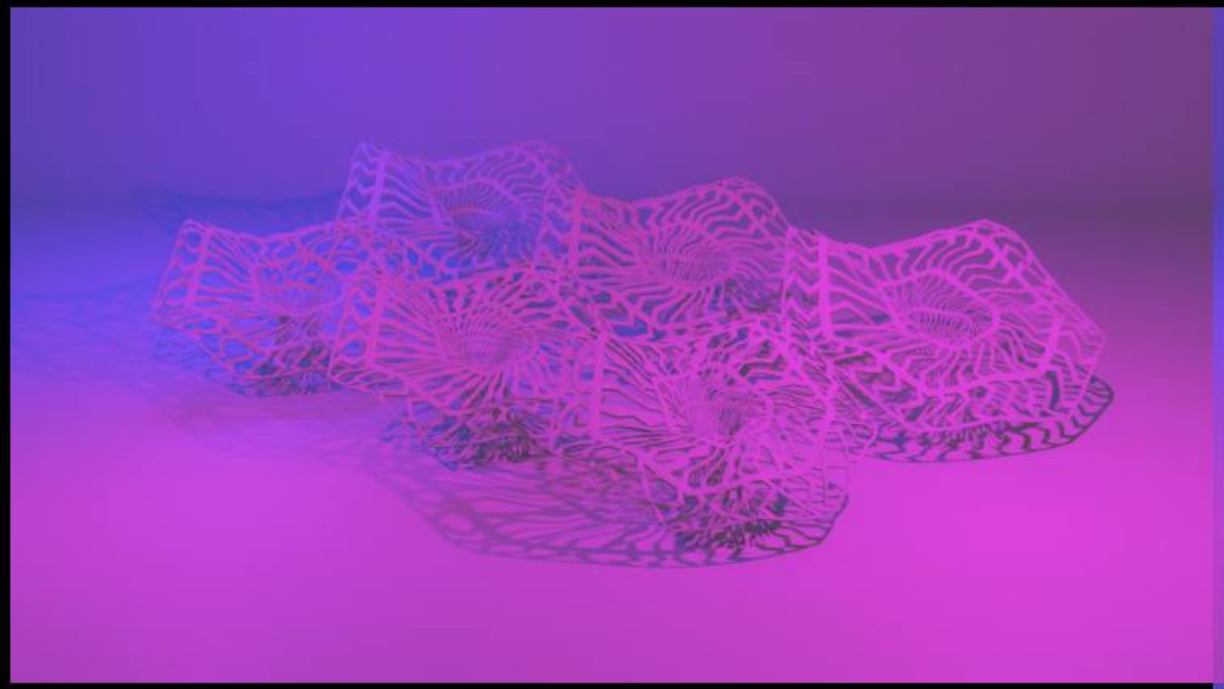

101 Iterations 46-72: Developing New Componnts

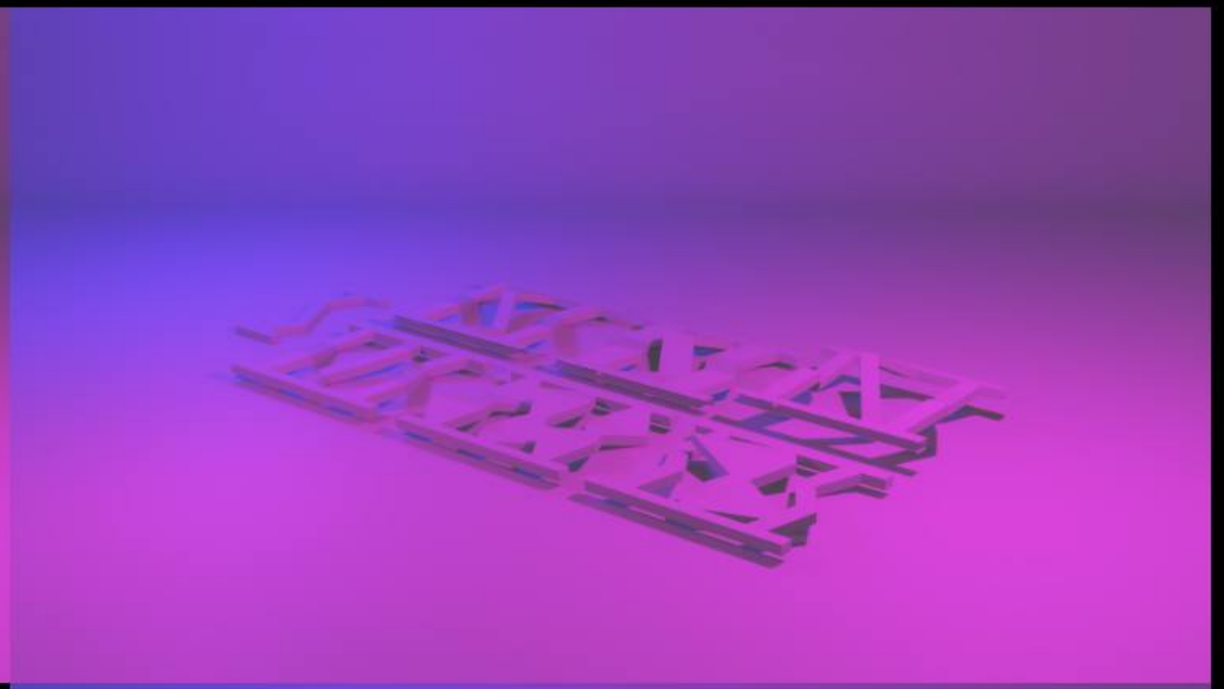

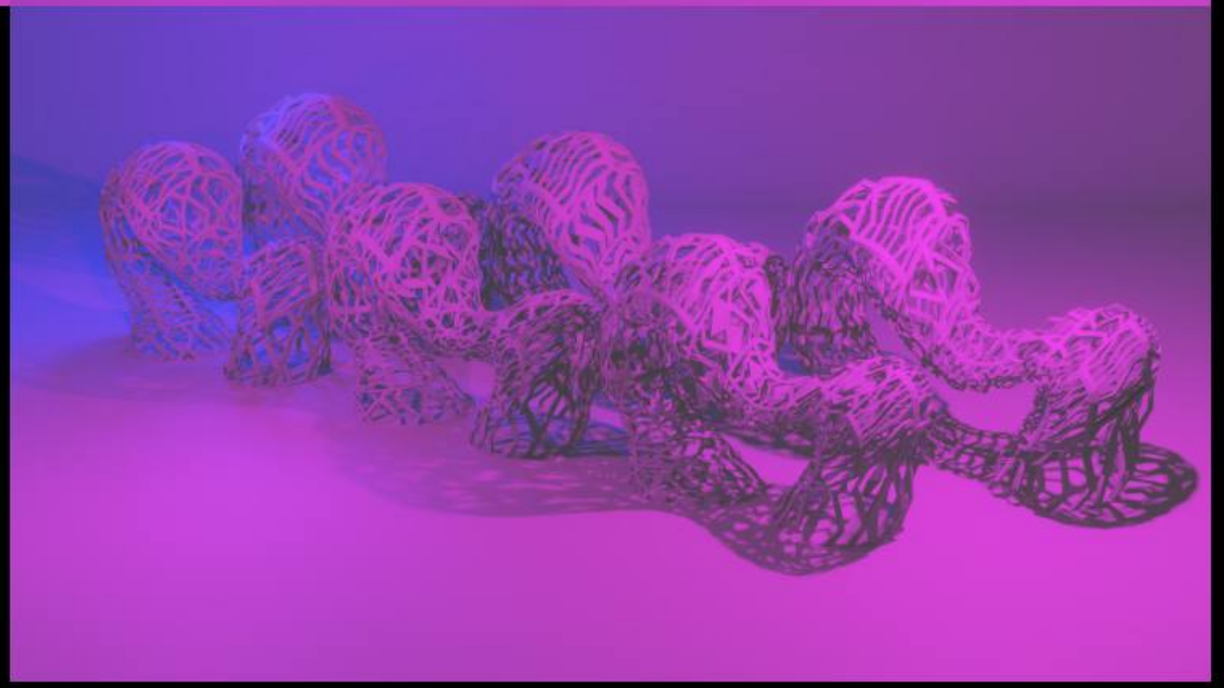

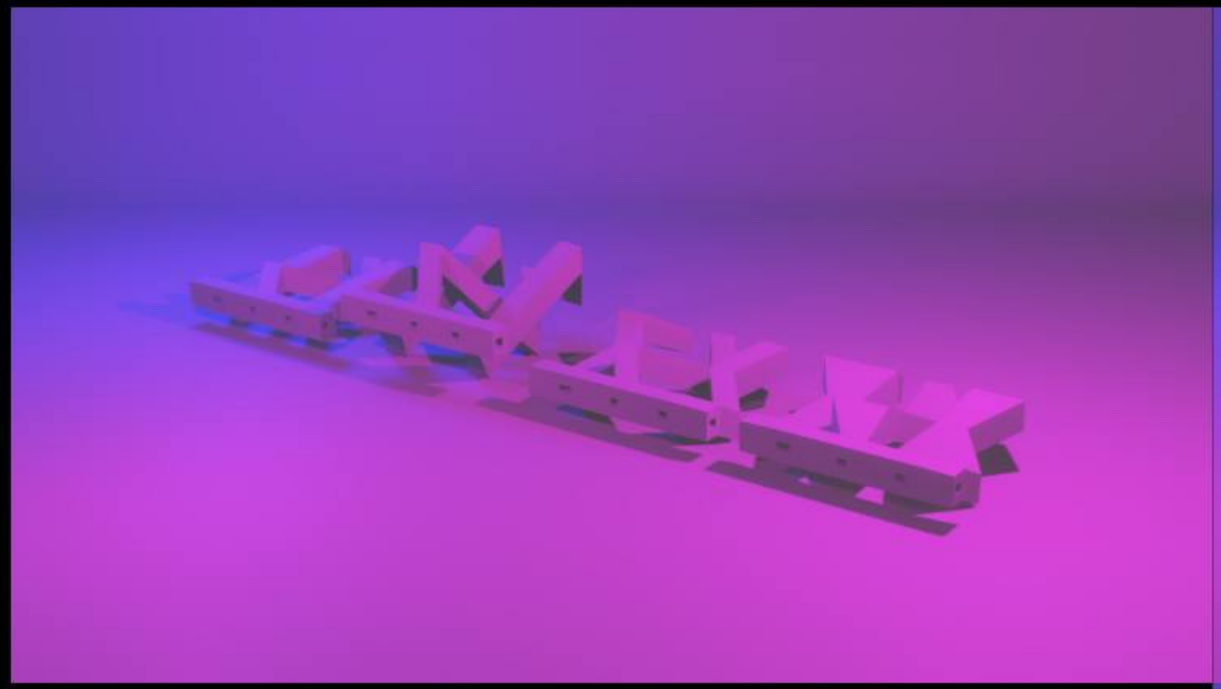

At this point in my design I believed I would go on with this form of the component, however I didnt think it had enough freeflowing structure, looking too boxed in.

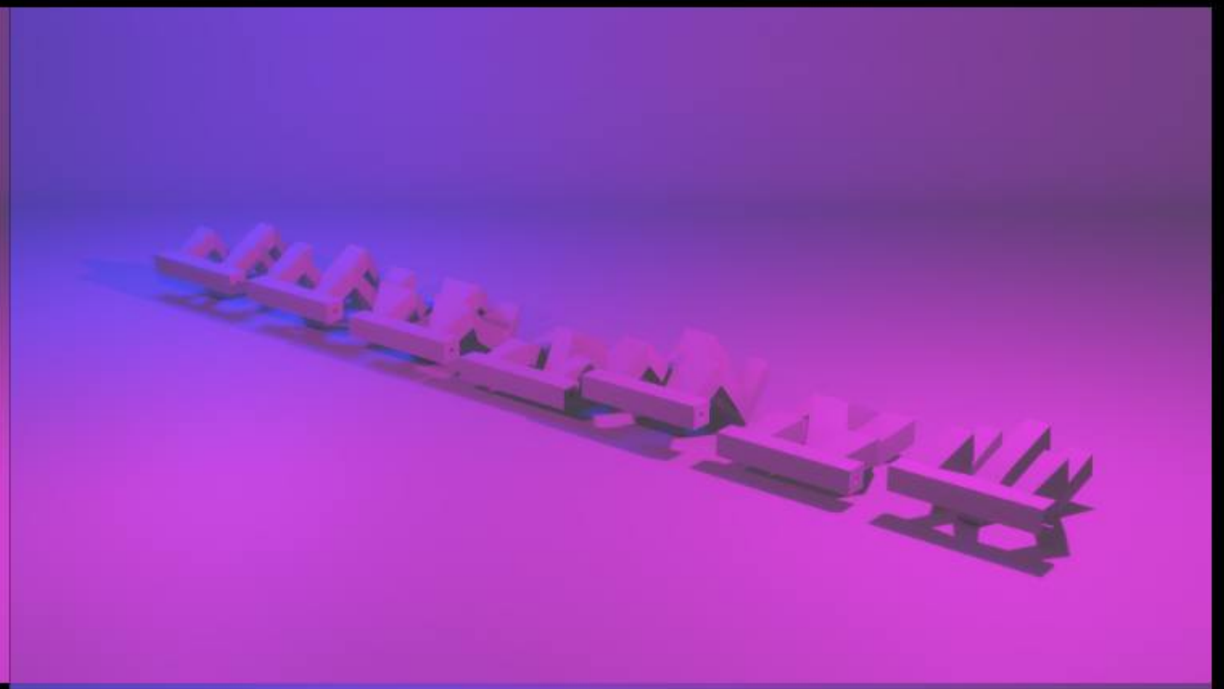

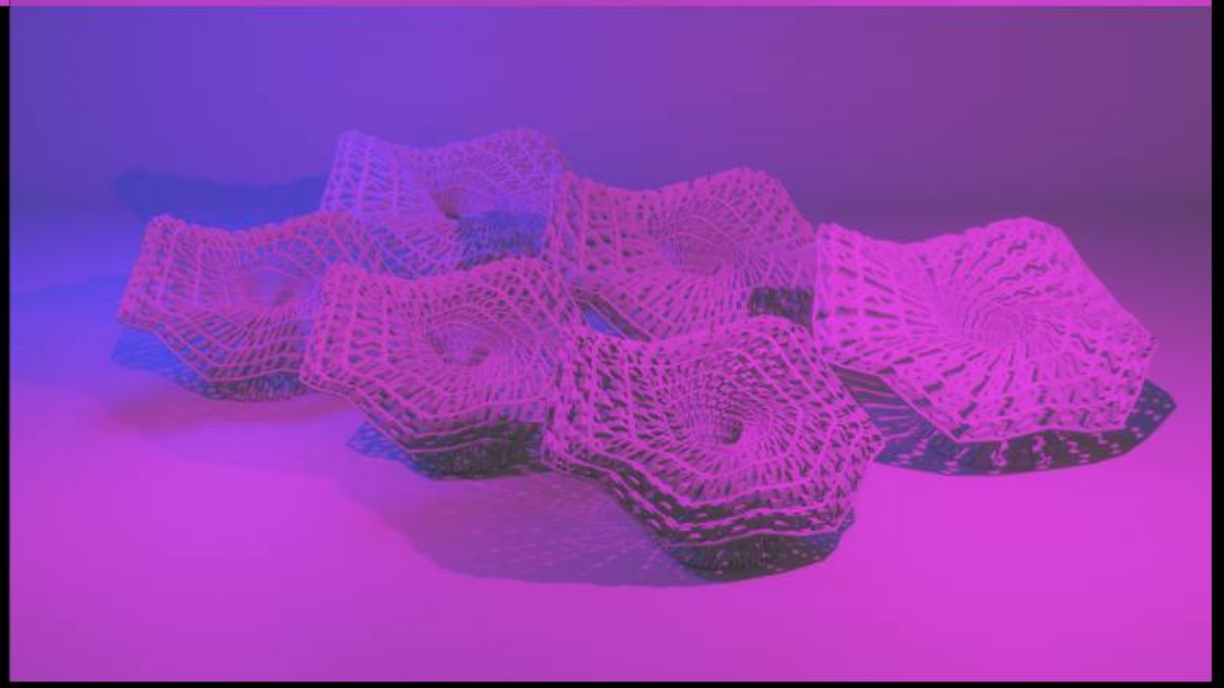

101 Iterations 73-108: Developing the Final Shape

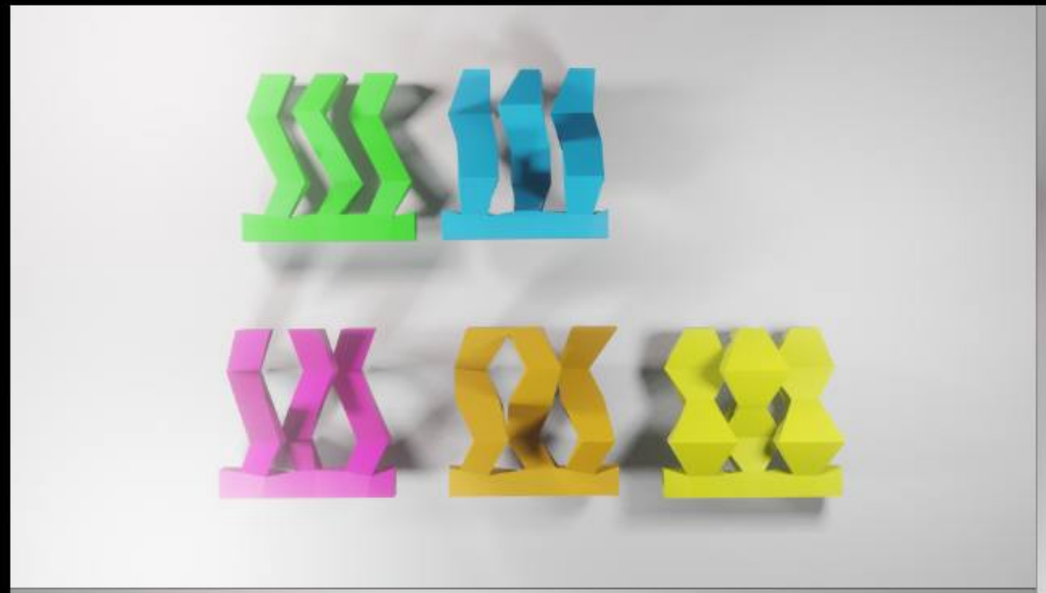

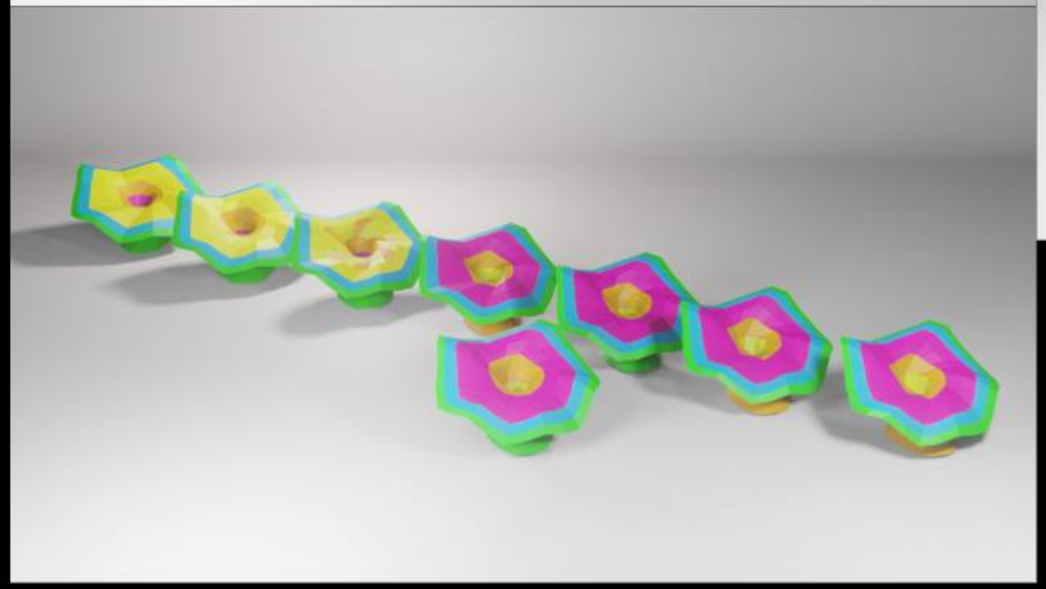

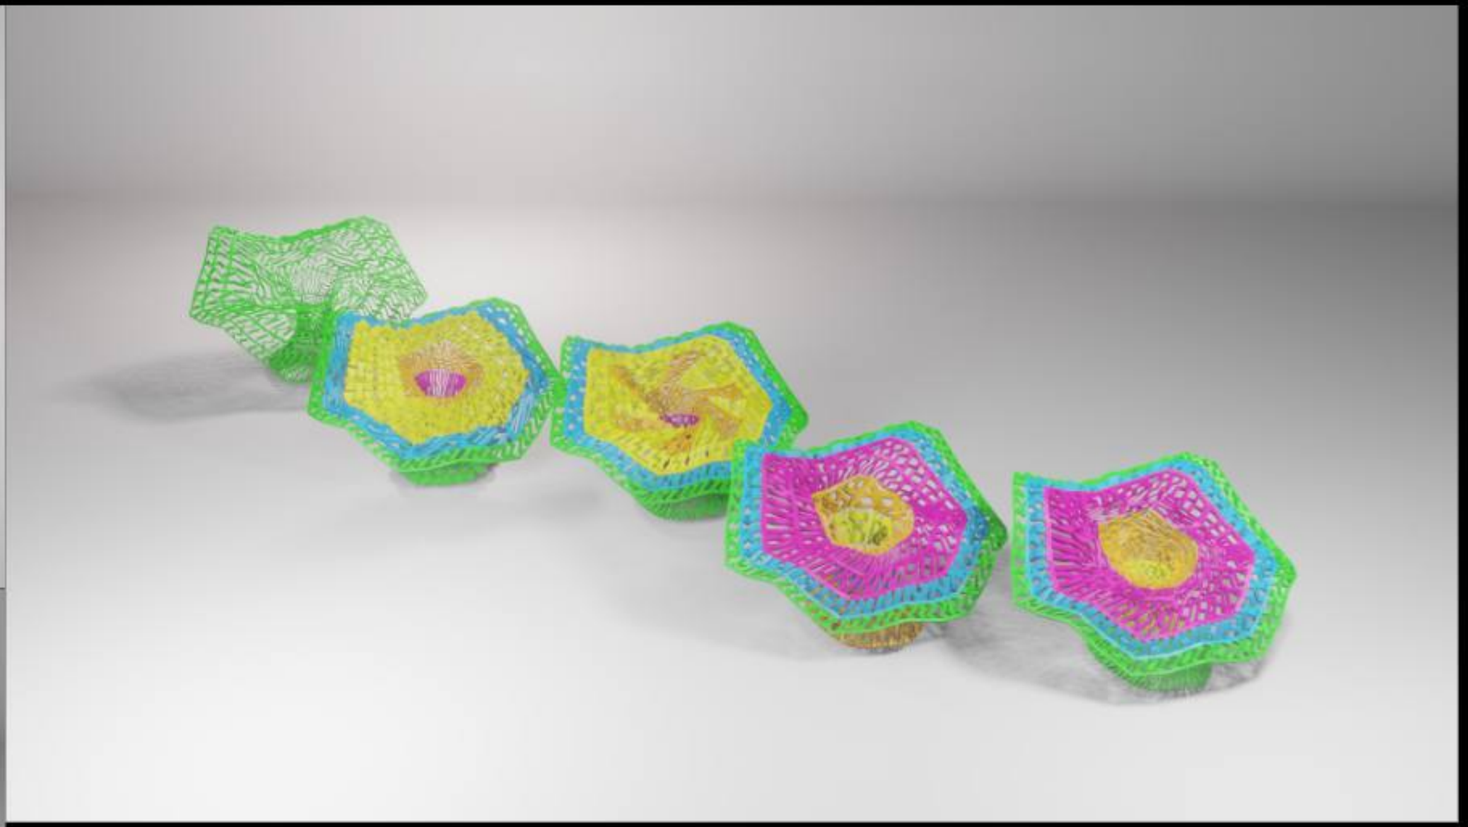

At this point I changed my component design to iterate on previous ideas, as well I played with shape keys for the purpose of applying multiple components to the bass model, using the material option.

I looked into using weight paint to add a level of variation to my bass mesh but decided against it, prefering th eidea of a more solid transition between components.

My goal with this was to create a final collection of components that spoke to eachother, but also allowed for variation in the final form.

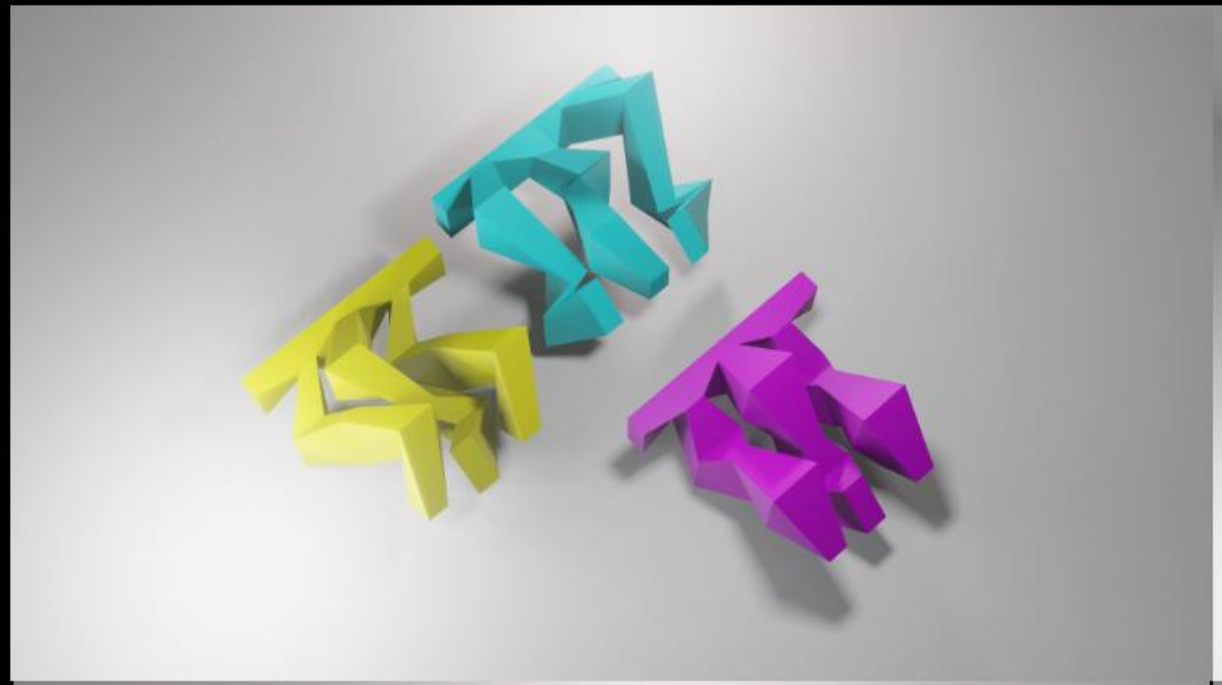

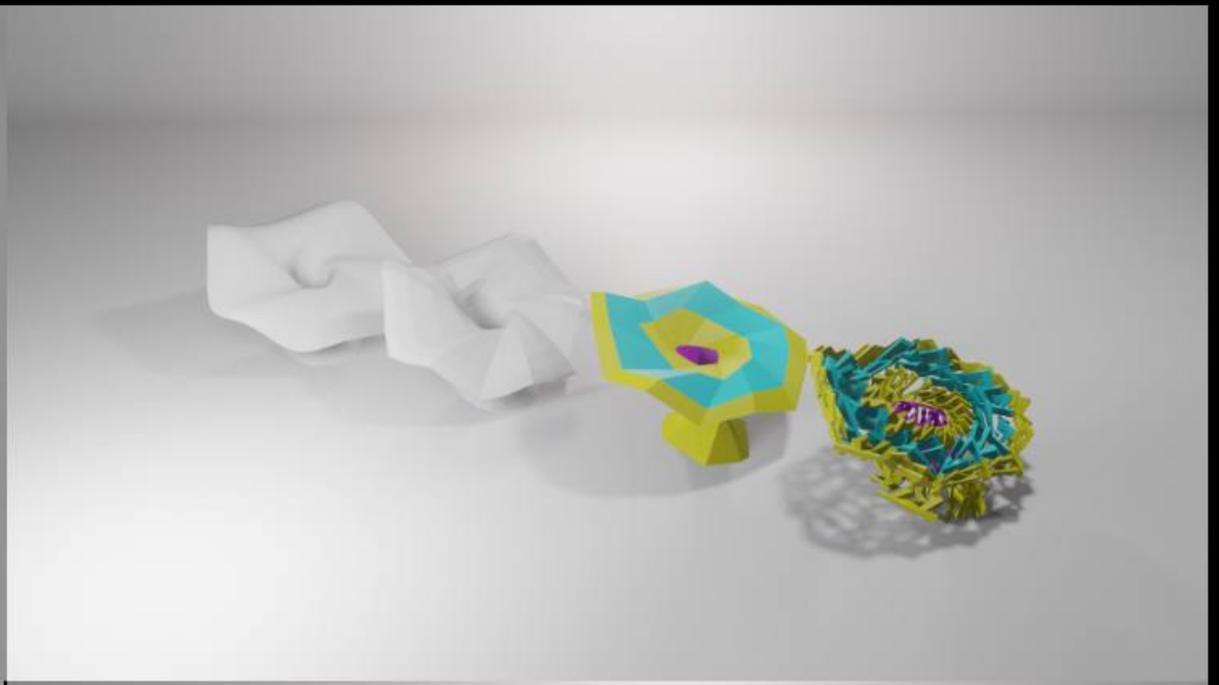

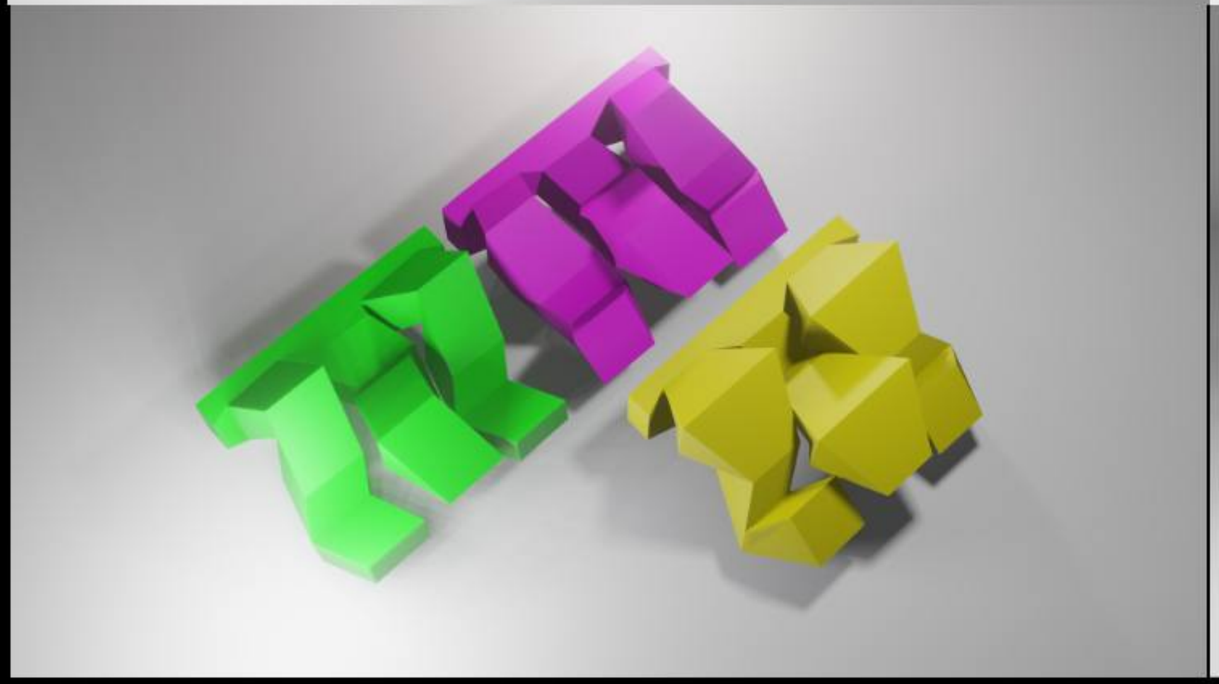

101 Iterations 109--130: Discovering the Lotus

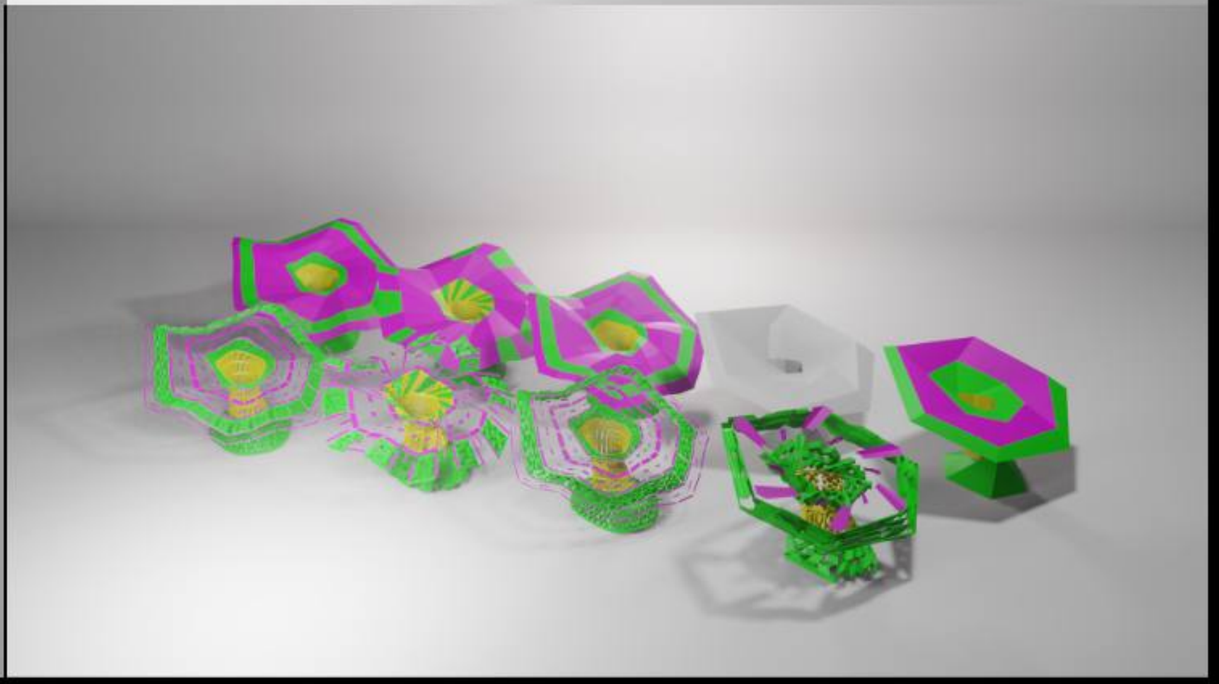

As I begun to play with materials, and their weights to make sure the design would print I discovered multiple weak points in the lotus's design, due to many of it's sloping corners which thinned out the components.

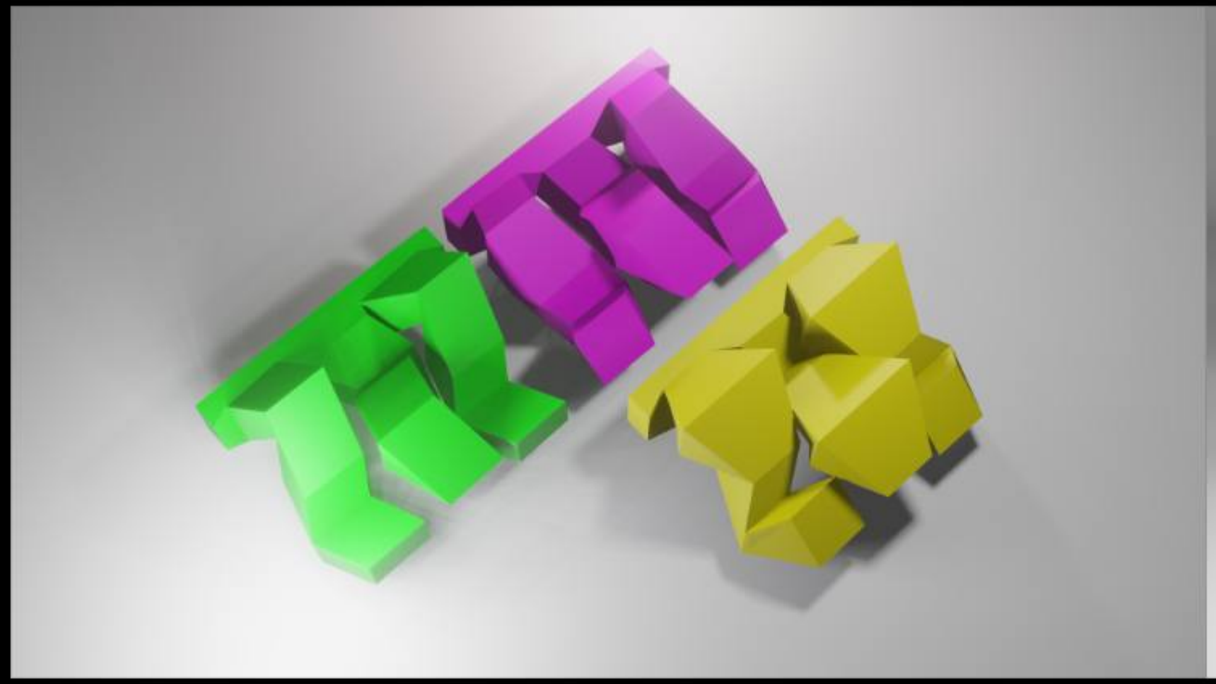

Playing with materials also taught me how the oreinatation effects the final design and how the new component's style when lined up would create geometric lines.

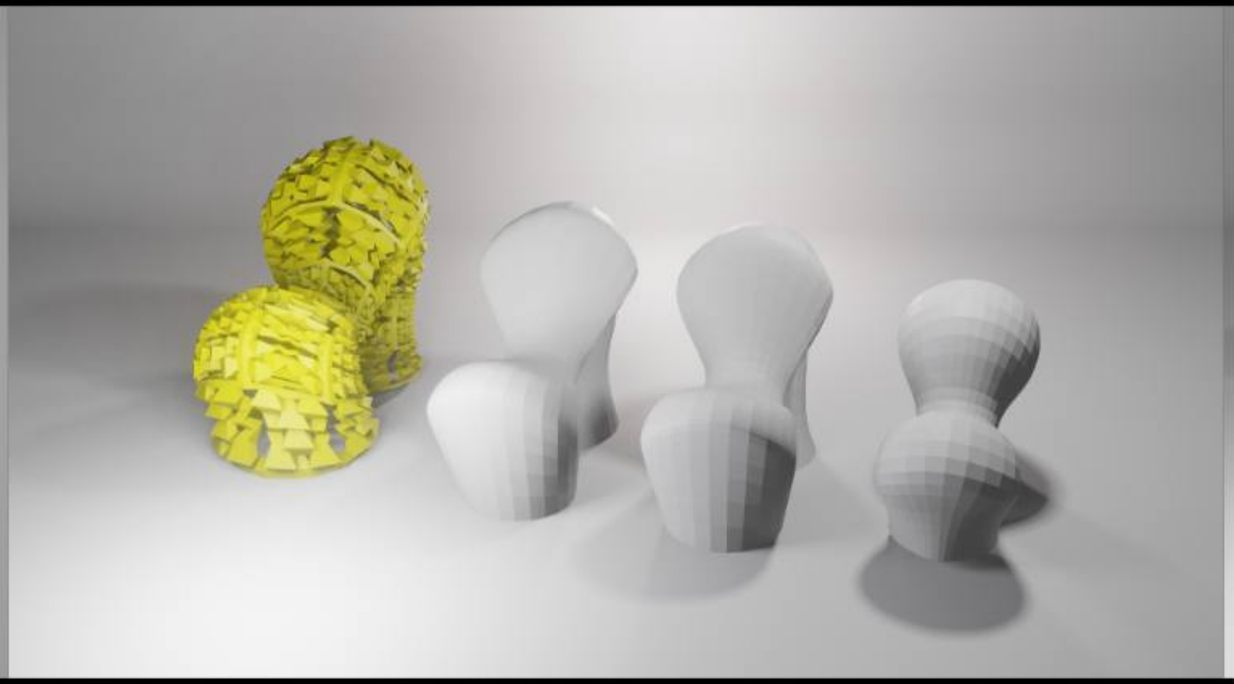

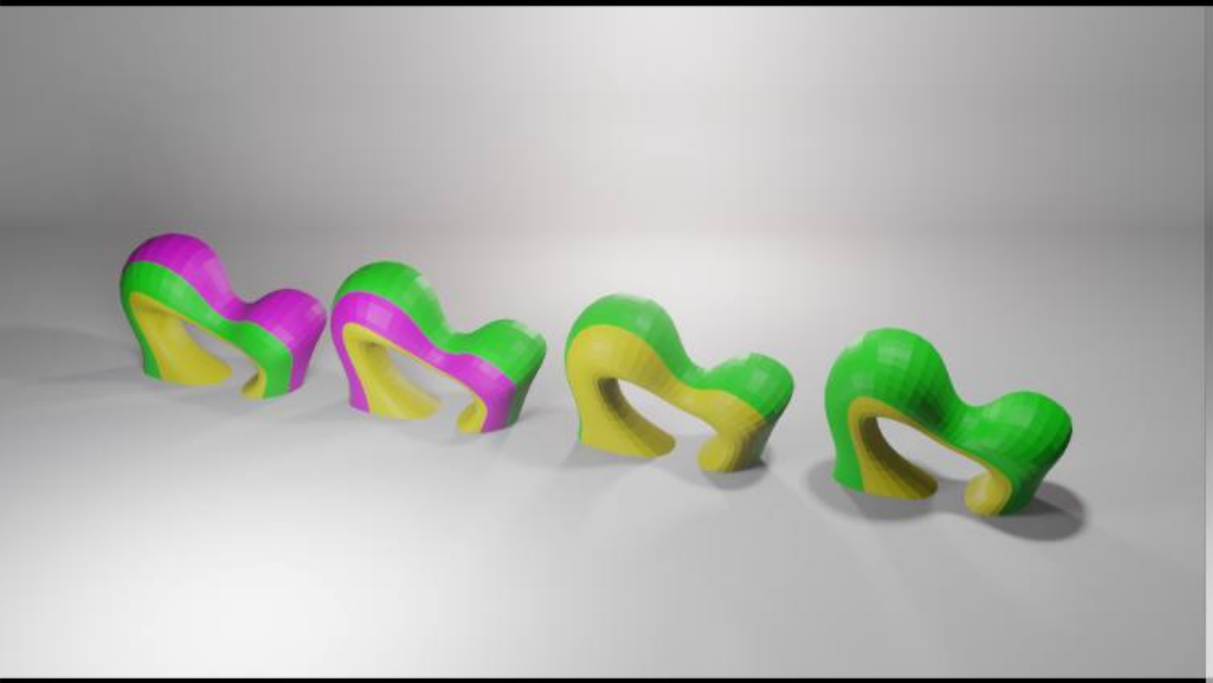

101 Iterations 131-142: Discovering the Wave

Instead of breaking the smooth geometry of the lotus I decided to go back to the wave design, I thought this model would give the same ideas, free flowing, organic shape, just without the complexity the lotus brought with it.

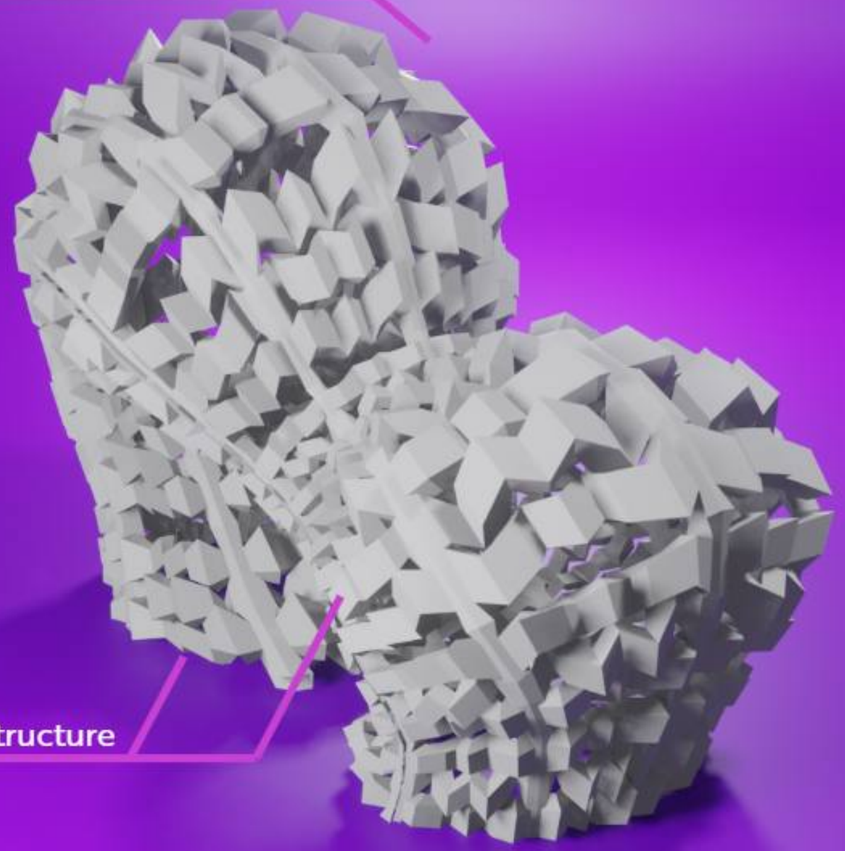

I developed the mix and match of materials and ended up with a design that only used 2, this served aesthetics and structure, as the under element is thicker, helping make the design thick enough for the curves.

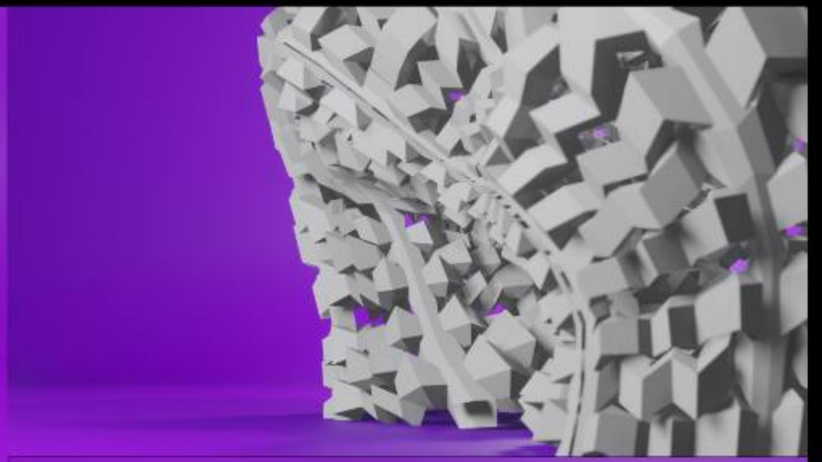

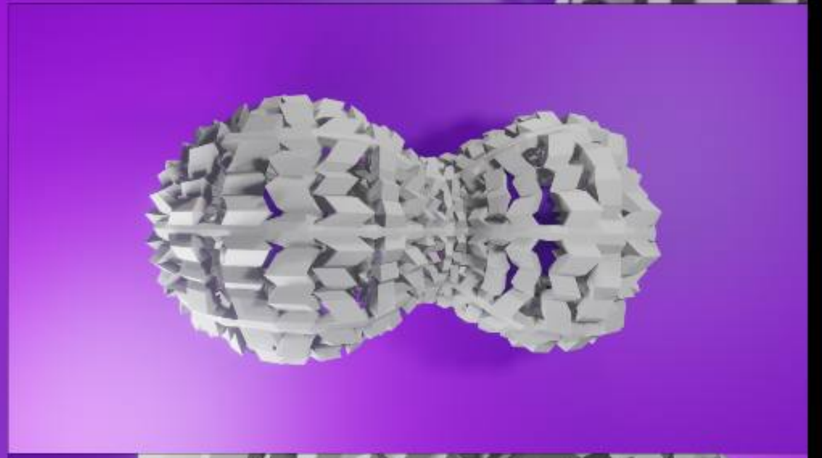

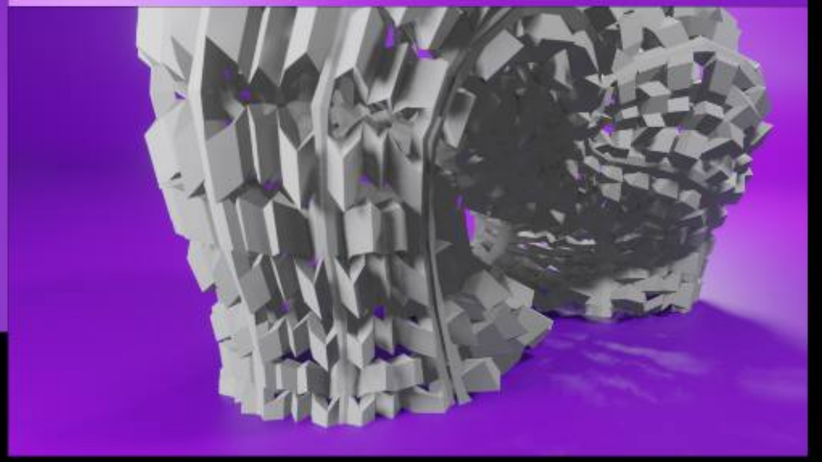

Soft, free-flowing ergonomic base mesh

Spikey, Structured, anti-human structure

101 Iterations 143: The Wave

My final design came out with the same messaging I wanted, an organic shape, juxtaposed with a sharp in-organic component.

For my second element I choose to crochet a cover for the front end of the seat, making it look more inviting untill you see it's spikey exterior.

Using crochet was an important element to me, this is because whilst manufacturing has advanced the craft has yet to be mechanised, not to lack of trying but because the exact number of muscle movements required, and the rapidly varying stitches, means it can't be recreated.

To me my final outcome is a soft shaped inviting chair, with a spikey anti human exterior, and a welcoming human made element.
