Iteration 101

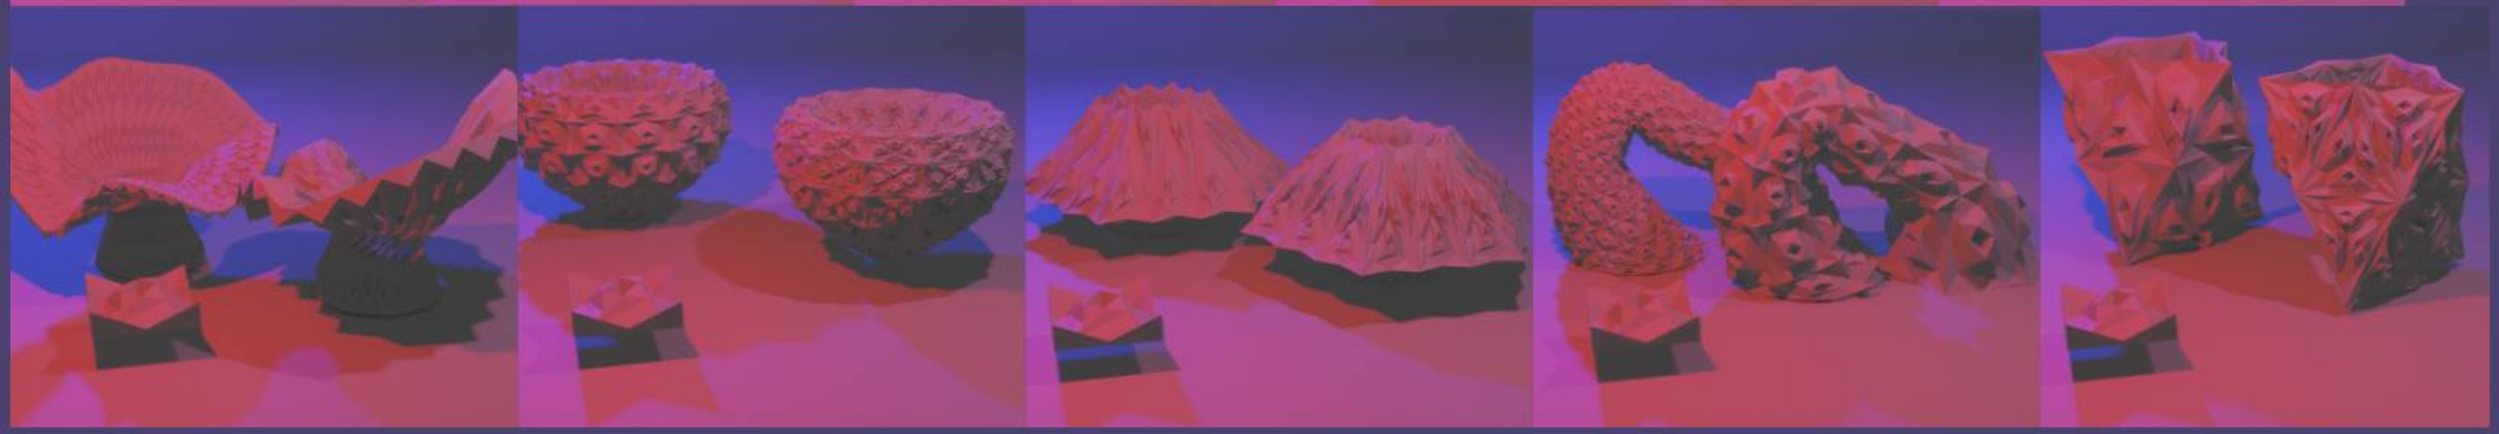

101 Iterations
Campell Smith

101 Iterations 1 - 25 (38) Learning the ropes

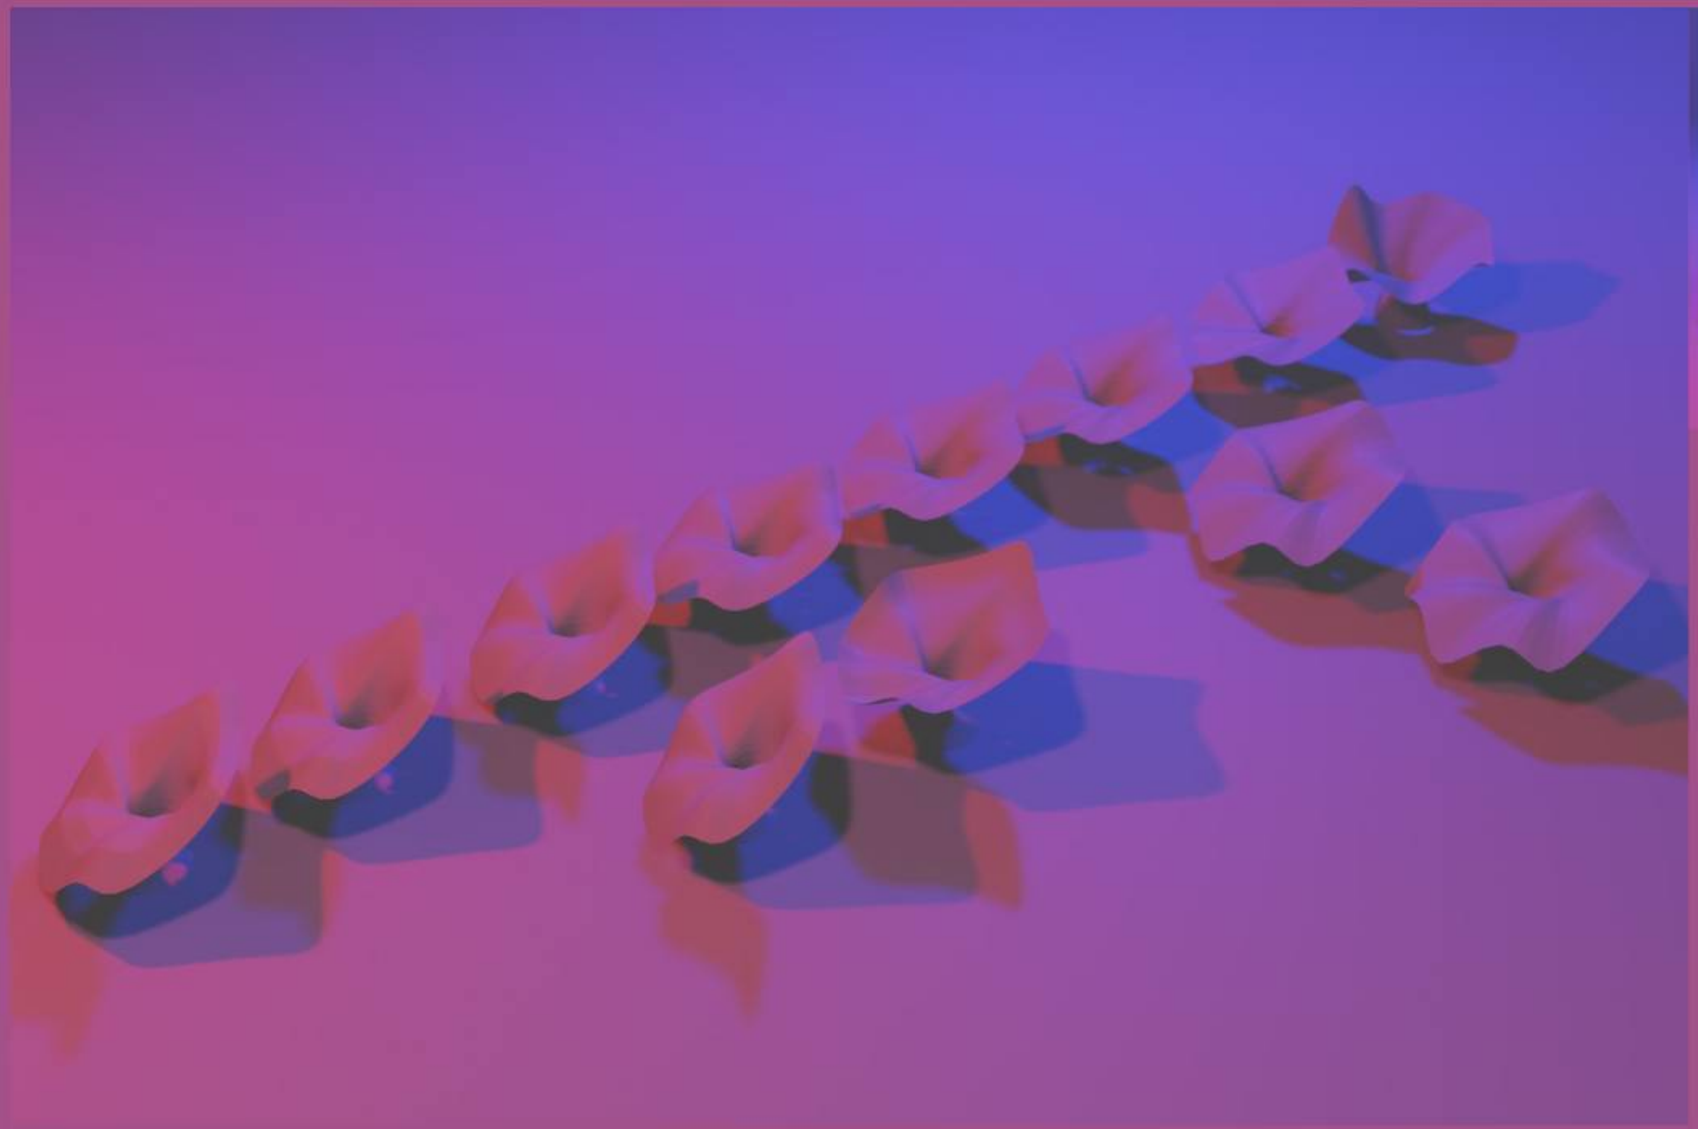

During my design process, I was heavily inspired by Space age Design in terms of my model. Space age Design is a design style that developed as a response to the production of space craft in the 60's, due to it's scientific creation of polymers, and the ever changing scene of mass manufacturing.

Designs of furniture during this time are characterised by their solid object appearance, looking as if they are made souly by one or two pieces.

My component design lent more into geometric shapes, wanting to play around with blender as a software I hadn't used prior.

I was inspired by online work I saw that's design used a control of depth, and empty space, to create it's geometry and tessilation.

I choose this creative route to try and contrast the more organic space designs of the models I had slowly developed.

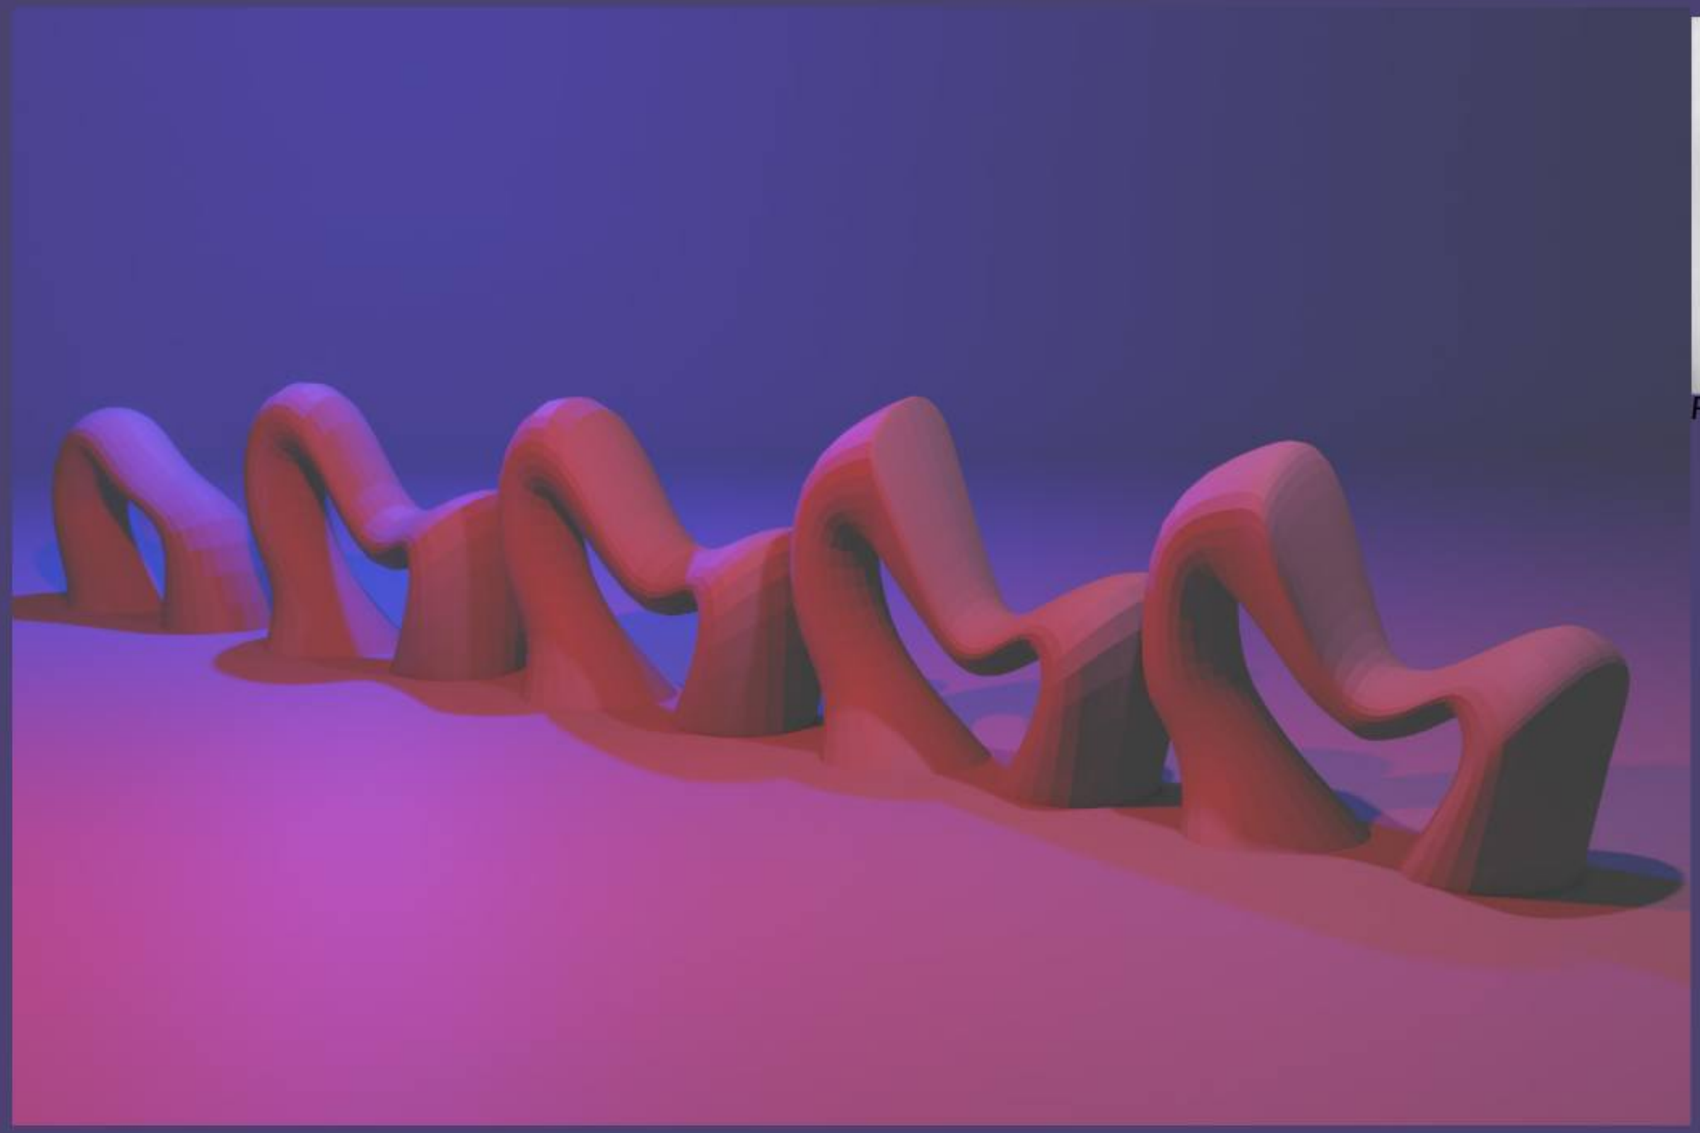

101 Iterations 26-50 (24) Exploring Aesthetic

After my Intial concepts I further developed the shapes of my models. I intially wanted to develop my components, but found I needed further work on my models, which lead to the development iterations pictured.

Figure 1.

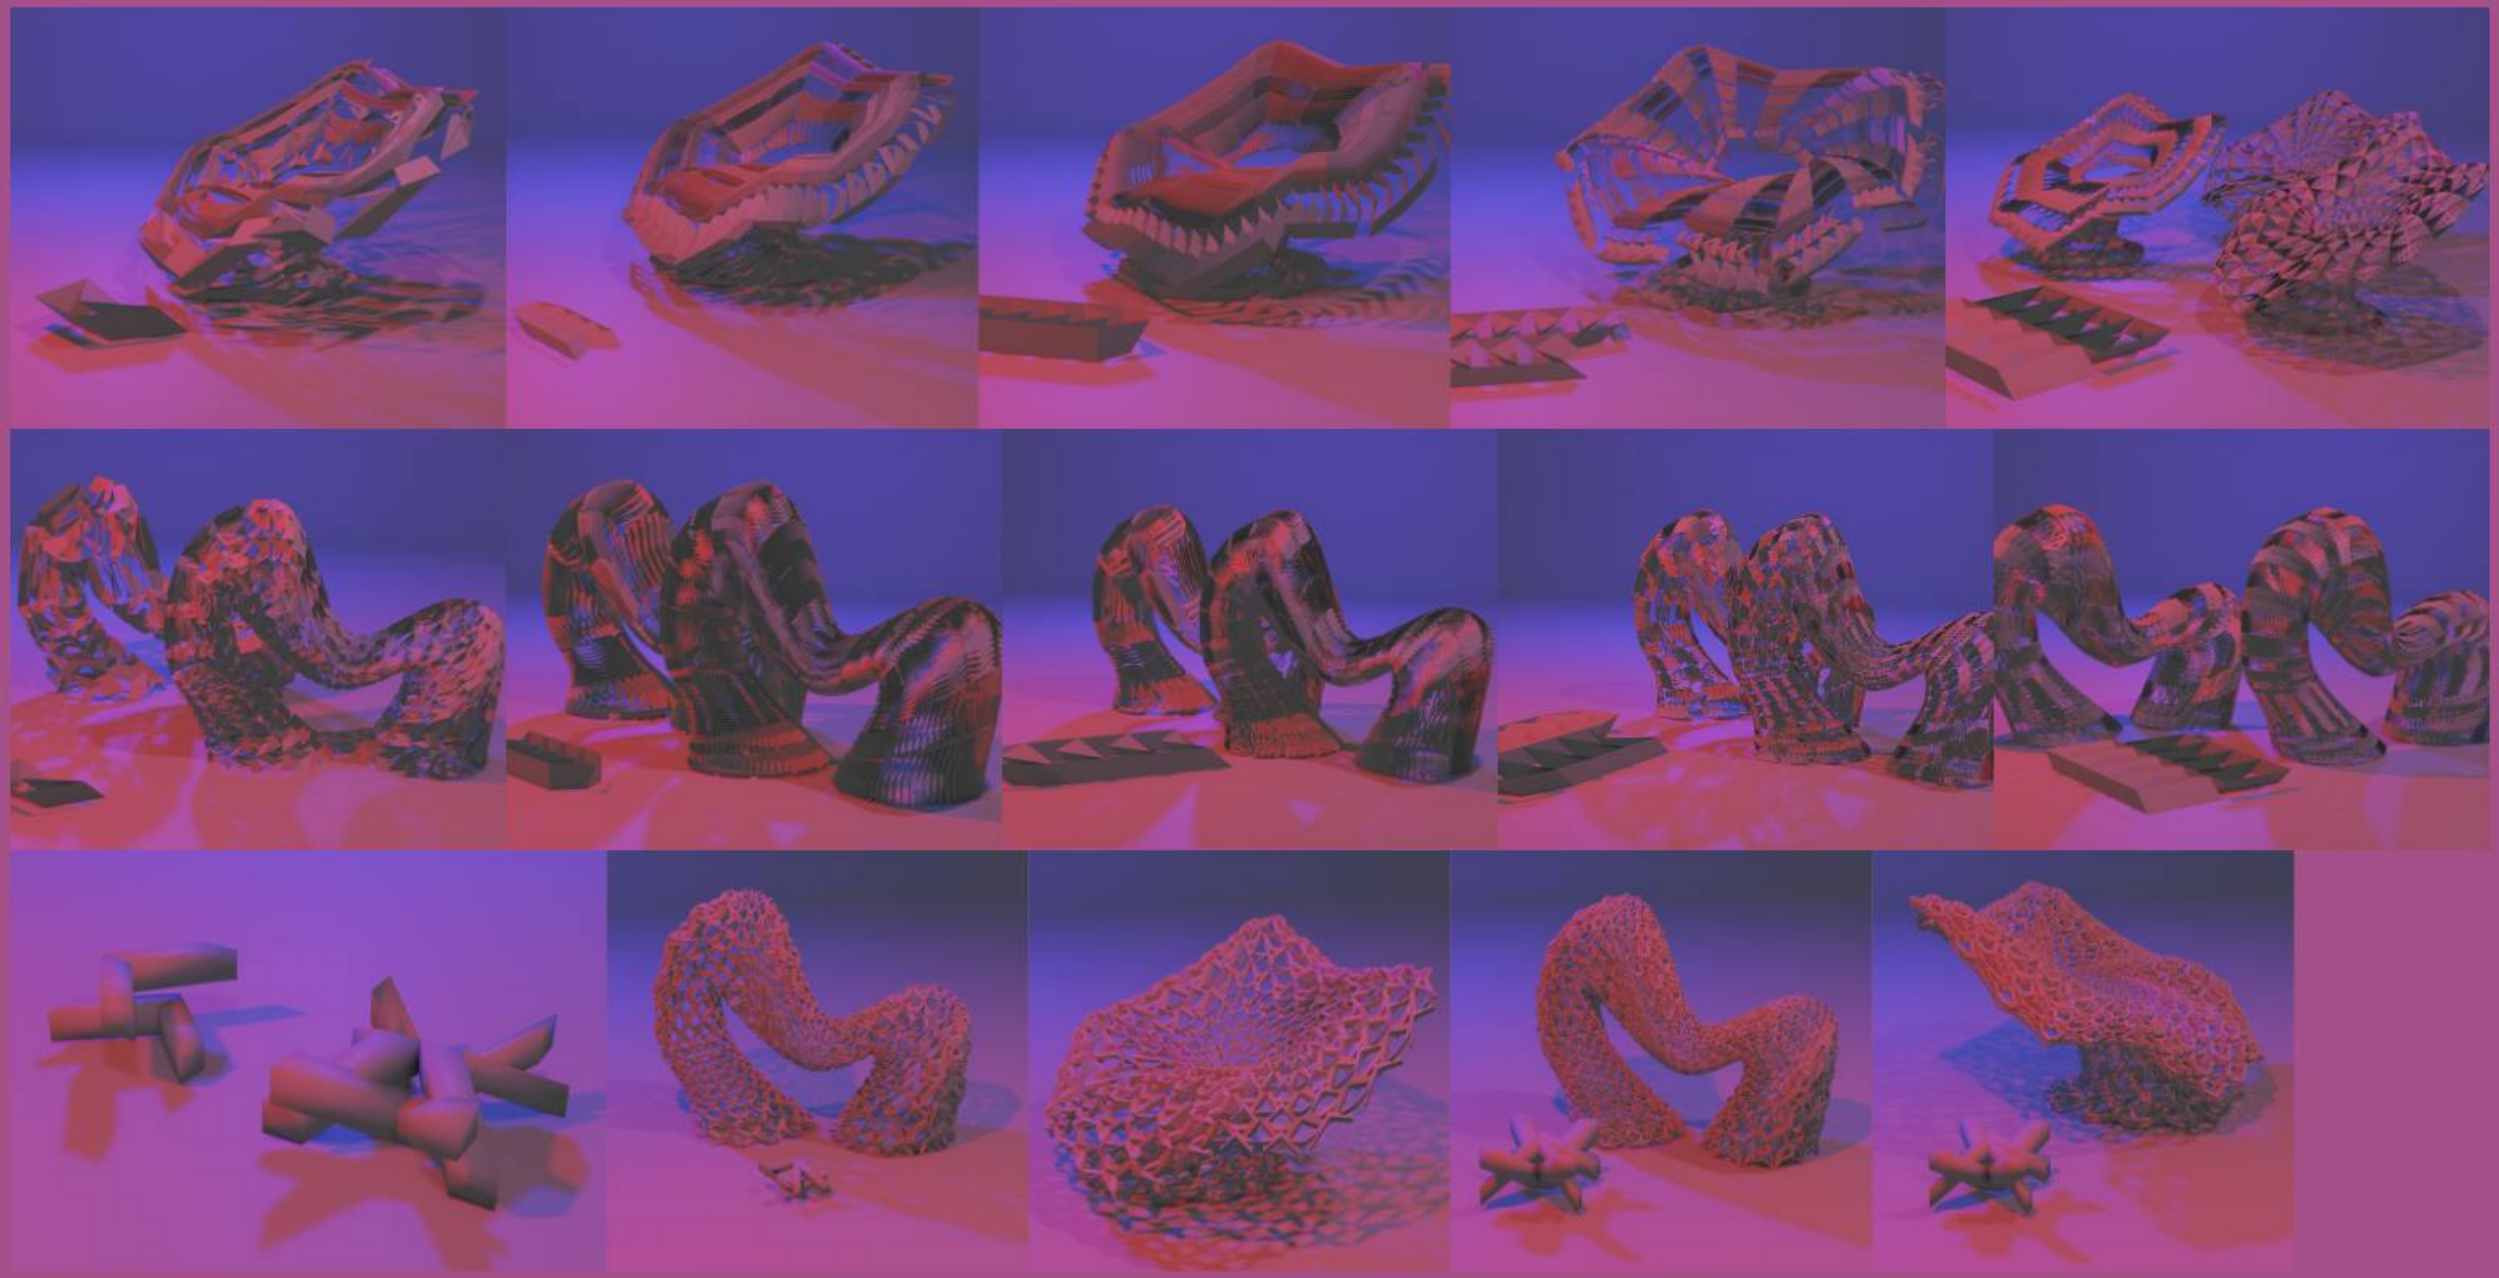

Figure 2.

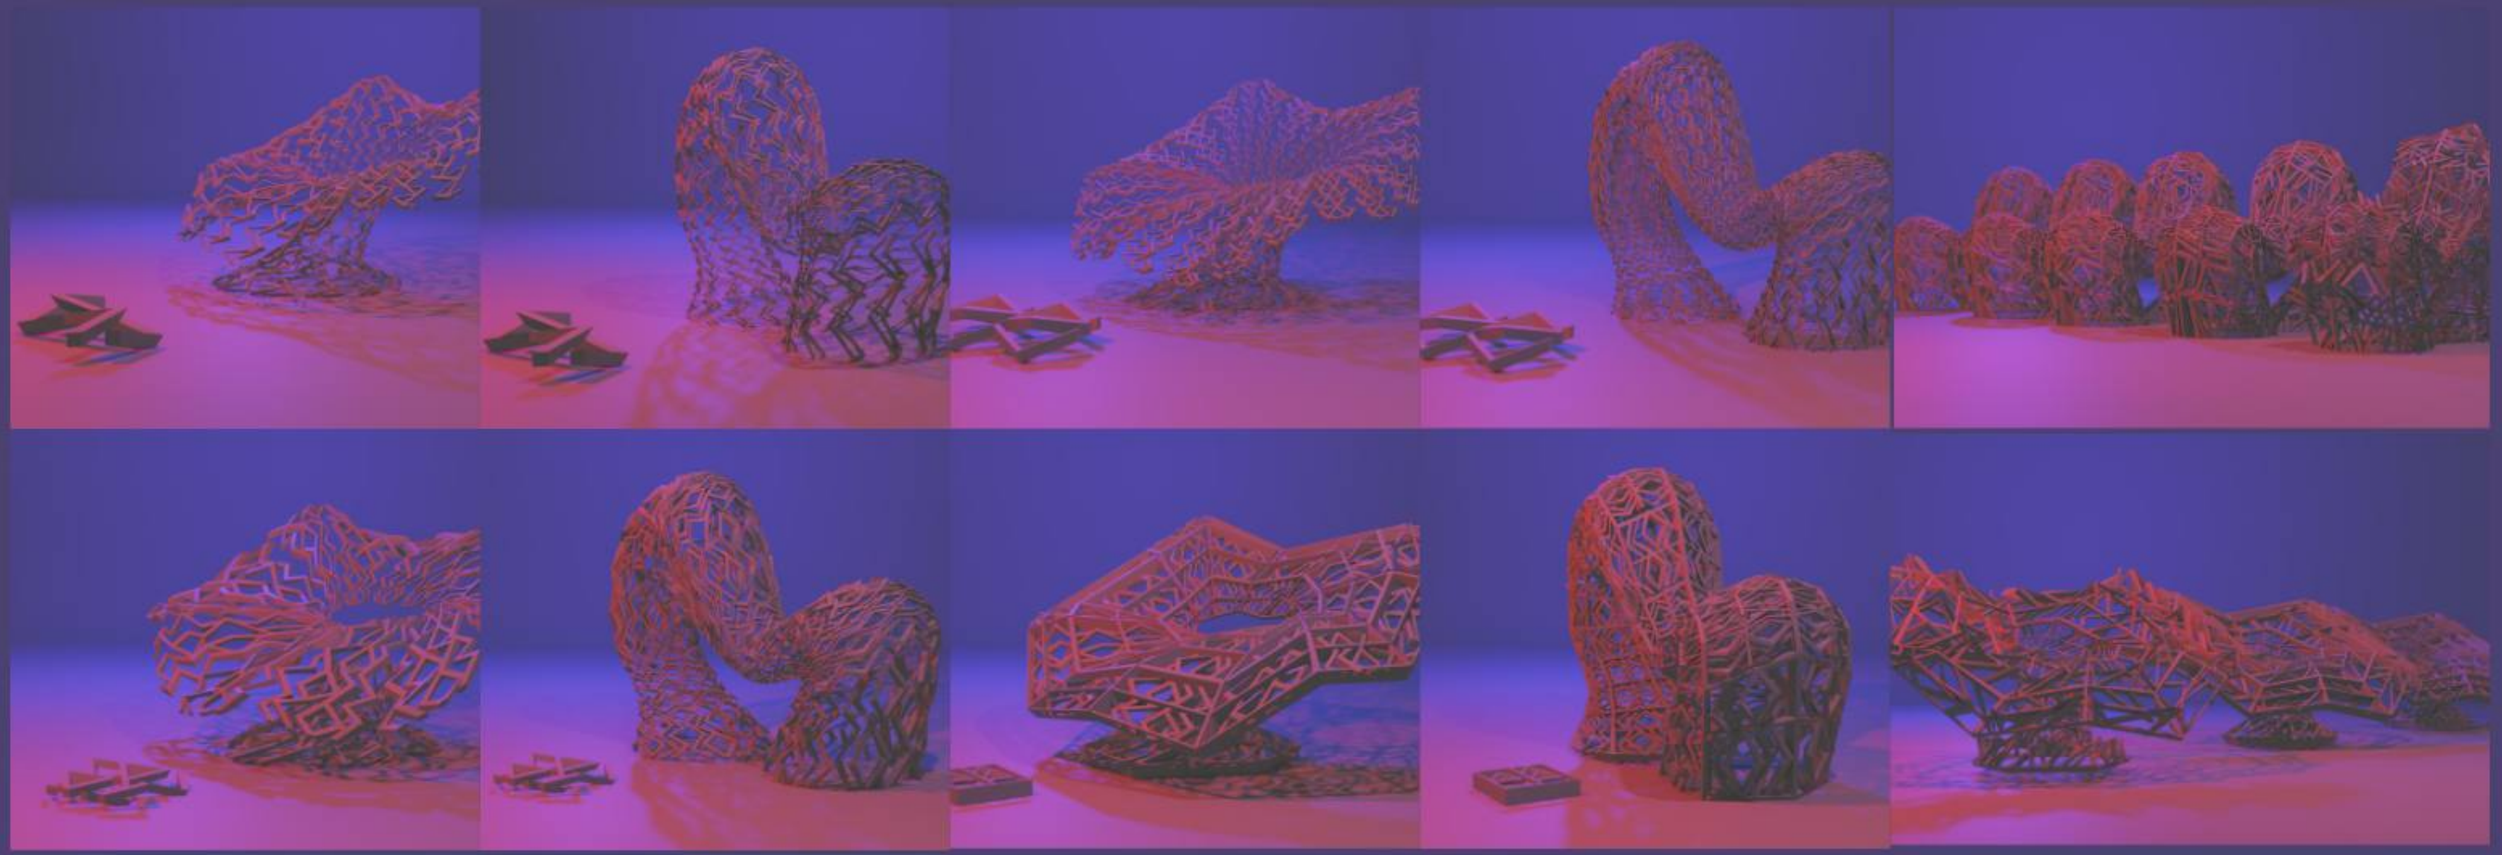

The developments I made pushed my model designs to become more human, heavily inspired by Verner Panton, who's designs are heavily characterised by their curves, in his chairs these follow characteristics that perfect sit the human form.
Often when I am looking for design inspiration I lean heavily on Panton's work. For his time he was experiemtnal with his use of materials, and I enjoy the playful, colourful, yet simple nature of his work.

I further want to develop upon my models with the more geometric compotents I had been trialing during my first 25, and touched on developing further here.

From my previous iterations, I found the complexity the simple hexagon based design offered the most interesting, enjoying the juxtaposition the angular shpae offered to the curvy models, as well as the way it was able to connect and build on itself.

101 Iterations 51-75 (24) Exploring Interface

Building off my previous component designs I took to building upon my already existing hexagon shape, then developing it further into more what I see myself finishing off with, a stronger more dynamic shape that plays with the chevron pattern.

From this point I want to decide on the base model I will stick with for the last 25 iterations, as developing for the two has left my with less room to explore components.

Both models I have ideas on how to build on, my simple Wiggle takes on the shapes of compotents nicely, stretching them to become more curved and natural, which I would juxtapose with a piece of wood for a seat.

In my more floral design works well with all compotents, and stands as the more interesting shape, for the hard object I would weave in my own crochet work which would add further complexity, and interesting messaging as crochet is a craft not possible to replicate by machine.

My main next goal would be to play aroundd more with geometry nodes, in terms of helping to create a more structured and tiled design of my last chevron pattern.

Whilst I touched on weight painting, and using formulas to change the outcome of my last two iterations, I feel with a more finallised component design i will beter be able to utilize these tools.

_101 Iterations
Iteration 76 - 100

Refining Form

Include any comments or descriptions of your process here.

This section might demonstrate your experiments and refinement of your basemesh form and further adaptations and variations of your tesselated component.

_Material Interface
Final Physical Prototype

Include a brief statement that addresses your process and the different elements you have combined to come to your final iteration.

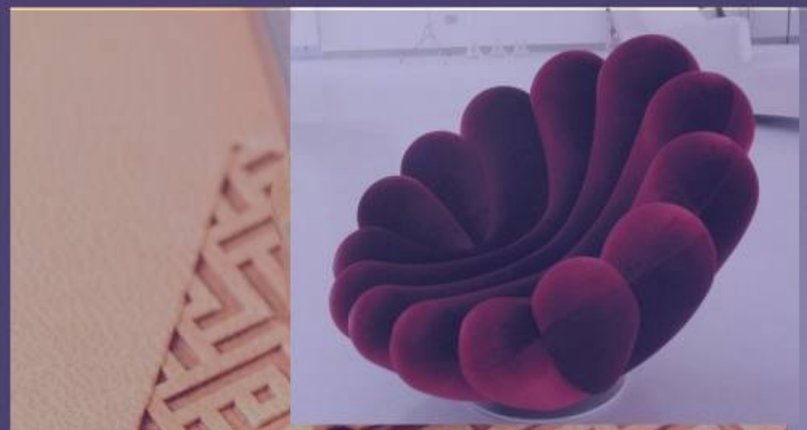

Discuss your intention for manufacturing your final iteration, including potential material usage and surface finish for your interfacing elements.

Brief statement (150 -200 words)
