The Pen Recycling Program

The Prototypes

Campbell Smith
DSDN 221: PJ2B

For the Ink Cartridge, I 3D Printed a functional model, where the cartridge can be taken apart, to fill it up with Ink or clean it, as need.

Functionally this would be the same design seen in the final design, just made with stronger materials, and different parts may be made with different materials to suite their needs, not just one solid material as seen in the print.

In my original proposal I talked about designing three advertising posters, in the end I only did two, as they felt like the only ones nessary, the third poster I made is a simple how to that would be put at the drop off point for users to understand how to take apart their own pen to replace the ink, just incase.

My first poster shows the consumer how the system works, and my second poster works as an attention grabbing advertisement.
