The Pen
Recycling
Program

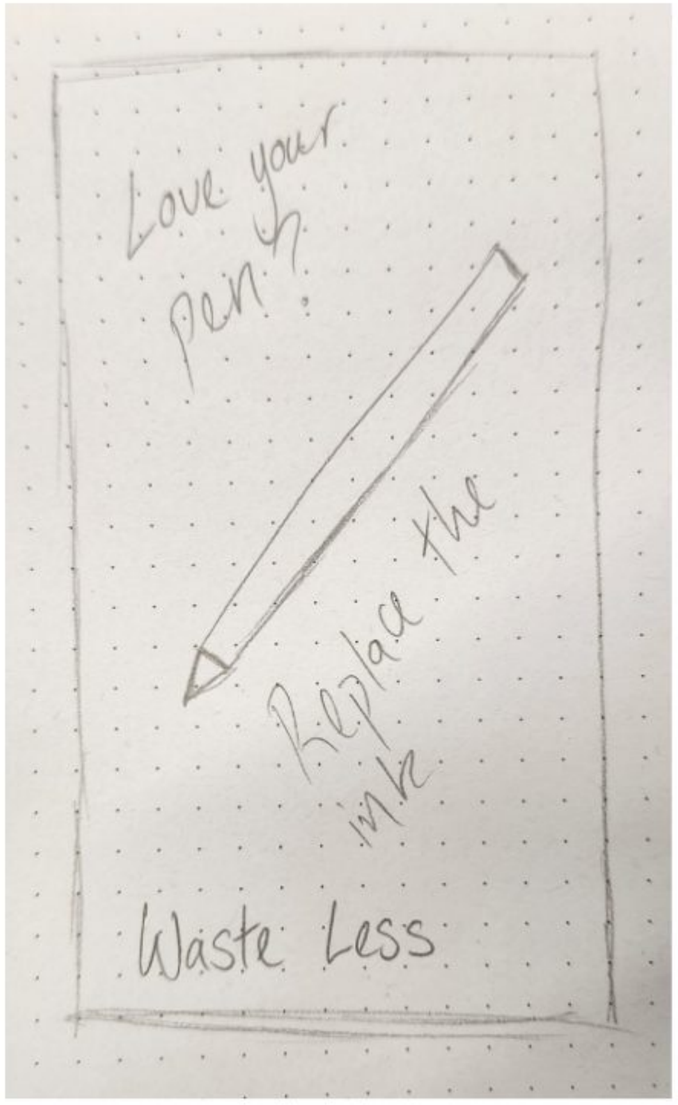

Intial Ideas

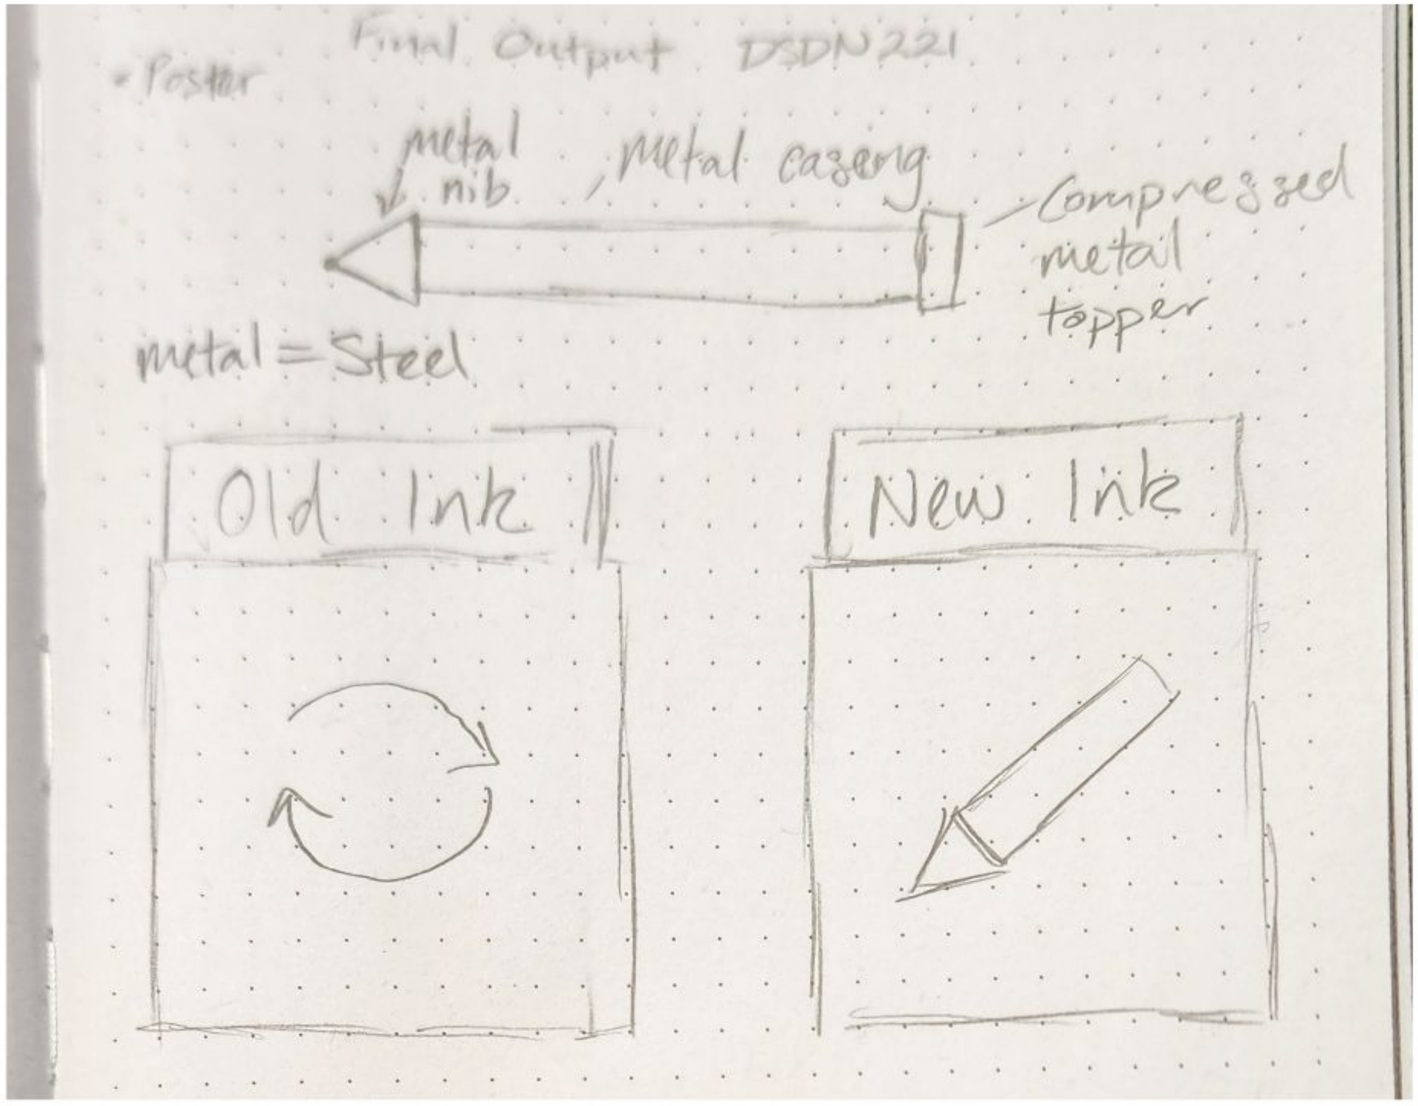

A issue I wanted to focus on within the design school, was the waste of pens. A large number of design students still use note-books and pens, intially I thought by creating a cheap, sustainably made, durable, and refillable pen I thought I could make a solution. I then changed tactics to look into a pen ink refill service, considering a majority of ink cartridges are the same. Intially I looked at the development of a metal pen with a cork grip, starting my focus on sustainable materials, and a durable design,

Developing the Concept

Here I looked at the steps that would need to be taken for the refillable service to be viable, and repeatable infinitly.

Developing the Concept

For my concept I wanted to develop the boxes which would house the new and old pen ink cartridges, as well as the materials used to create the new refillable ink cartridges. The poster design, on the left, is what I am looking and developing into for a final output.

A Recyled Steel, pressured cap. Keeps ink in the pen, and it's pressure sealing means it won't acidently come loose untill it's needed to be cleaned for it's next refill.

A Recyled Steel, ink chamber. Steel breaks down naturally, and is durable without being porous, perfect for holding a liquid.

A Recyled Steel, pen nib. The nib will use a typical ballpoint nib, all of this too can be made of steel.
