Campbell Smith.DSDN104.Project 1

For Precedents I based the main seed on the naturally occuring divots in poppy seeds, and gave them the more structured 'bloolook of the Verner Panton, 'Living Tower'. The external tendrils built upon the design, to create more supports and exploit the deviation I could get from the 3D printer.

My final design I wanted to create a narrow seperation from design and printer, everything coming into a coily odd and natural, whilst unartural design. The result from the printer, reminds me of the liquid, coily look of the symbiote design used in the venom movies, or a peices of cew gum.
