

Campbell Smith: The Wave

The keychain is inspired by the organic, yet inorganic shapes of permanent magnets. These magnets pull and push metal to create odd shapes, that almost look human made.

For my design I utilized the automate feature on fusion, pushing it to create the shape that would connect organic shapes and the edge to the center bar. This automated shape created a soft, and round organic shape that I then manipulated by slicing and scaling to alter how the shape filled the overall space.

The colour of the design is inspired by the breaking of waves on sand with layers of translucent greens and blues, creating a glitch-like effect, where you may spot colours from lower layers showing through. Only from the side are you able to see all the colours stand on their own.

My renders allowed me to look closely at details you can't see in the final print from all angles. For my renders I wanted to focus in on what made the design special, the layers, which set a strong contrast to the natural shape of the pattern in the design.

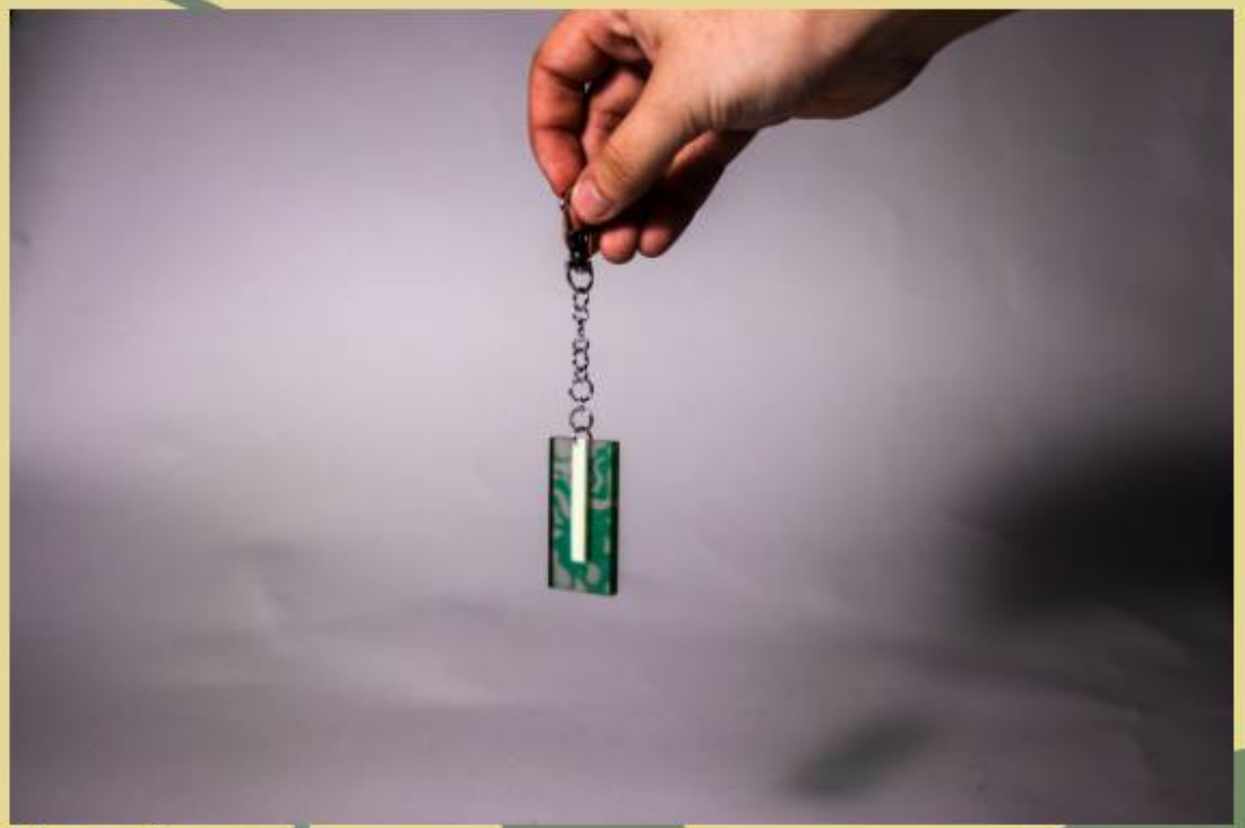

Photo One.

The first two photos I wanted to look at the overall design and how it performed in normal circumstances.

Photo one shows the design at scale against my hand, showing length of the chain, overall size, colour and shape in contrast to a human hand.

Photo Two.

Photo two shows the design functioning as a bag keychain, what the design looks like attached and placed next to the object it serves it's function for.

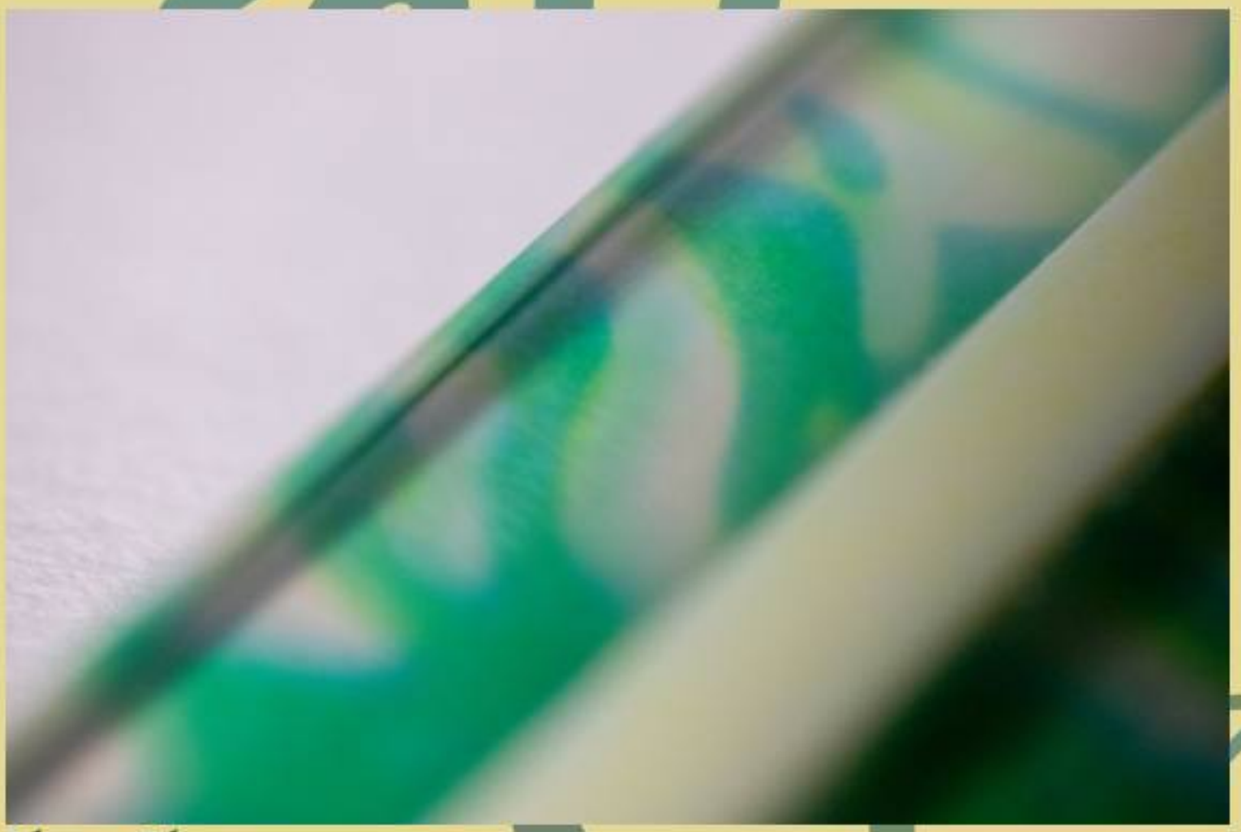

Photo Three.

In the second pair of photos I wanted to take the design under a macro lense and capture what I wanted the key aspects of the design to be.

Photo three looks at how the colours blend and blur together. I wanted to cause a glitch-like effect when looking at the design, as you change the angle of viewing, you will notice the colours vary.

Photo Four.

Campbell Smith: The Photos

Photo four takes a closer look at the staggered layers of the design showing how the glitch effect is achieved in the third photograph.
